

CSIE30600/CSIEB0290
Database Systems

Lecture 7:
Entity-Relationship(ER)
Model

Chapter Outline

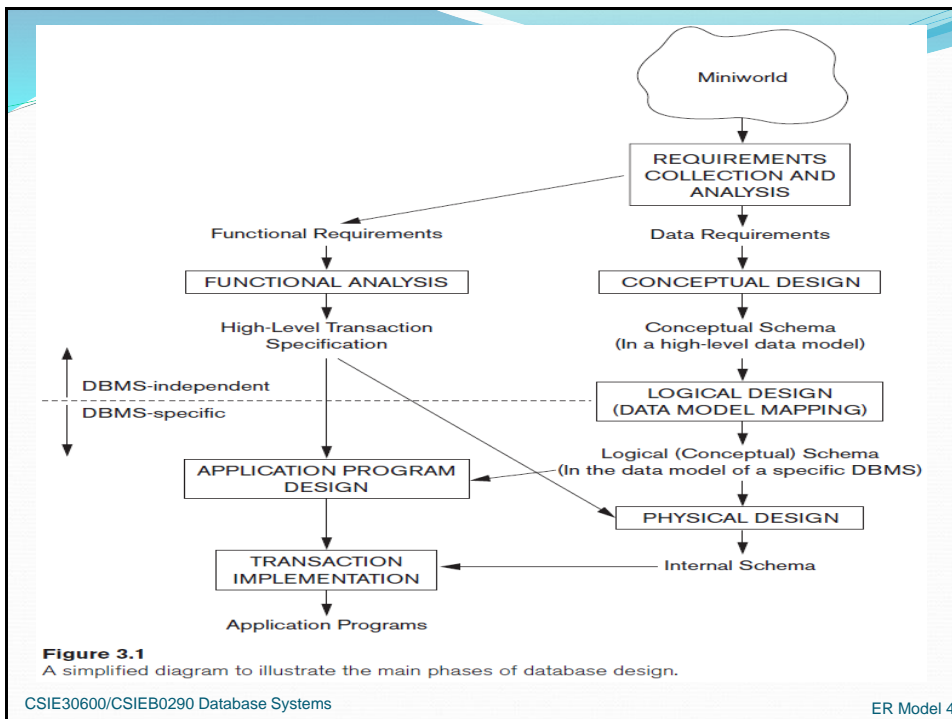

- Overview of Database Design Process
- Example Database Application (COMPANY)
- ER Model Concepts
 - Entities and Attributes
 - Entity Types, Value Sets, and Key Attributes
 - Relationships and Relationship Types
 - Weak Entity Types
 - Roles and Attributes in Relationship Types
- ER Diagrams - Notation
- ER Diagram for COMPANY Schema
- Alternative Notations – UML class diagrams, others
- Relationships of Higher Degree

Overview of DB Design Process

- Two main activities:
 - **Database** design
 - **Applications** design
- Focus in this lecture on **conceptual design**
 - To design the **conceptual schema** for a database application
- Applications design focuses on the **programs** and **interfaces** that access the database
 - Generally considered part of software engineering

CSIE30600/CSIEB0290 Database Systems

ER Model 3

CSIE30600/CSIEB0290 Database Systems

ER Model 4

Overview of Database Design (1)

- **Requirements collection and analysis**
 - Database designers interview prospective database users to understand the **problem** and **needs**.
 - Characterize fully the **requirements** of the users and application.
- **Result**
 - **Data requirements**
 - **Functional requirements** of the application

Overview of Database Design (2)

- **Conceptual design**
 - Choose a **data model** (eg. relational model)
 - **Analyze 'problem'**, define which information the database must hold and the relationships among the components of the information
 - Understand **what** users want from database
 - What are the **entities** and **relationships** and **attributes** in the enterprise?
 - Use a **language** to specify design -- **ER Model** is used for this (simple yet precise description). The design is depicted by an **ER diagram**.
 - The result is a **conceptual schema**.

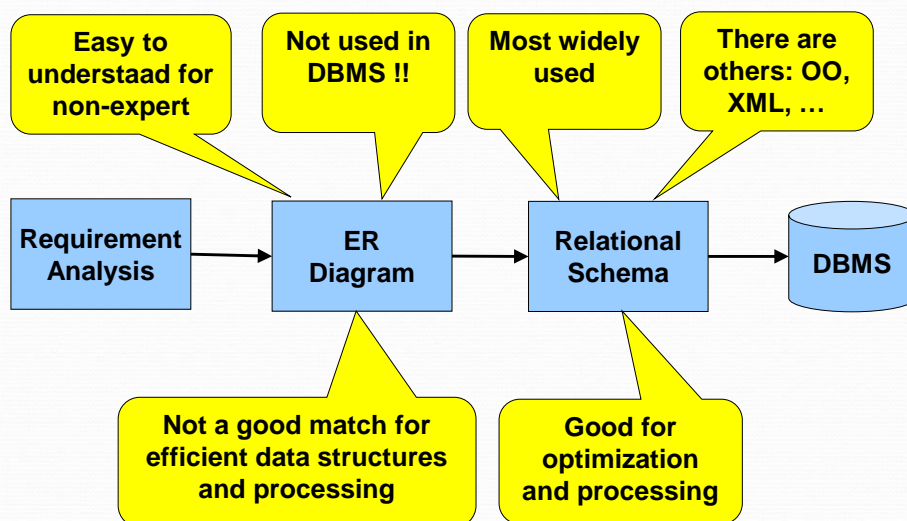

Overview of Database Design (3)

- **Logical design** or **data model mapping**
 - ER diagram is converted into a **relational schema**
 - Check relational schema for redundancies and related anomalies – **Normalization**
 - Input schema to **DBMS**
- **Physical database design** and **tuning**
 - Consider typical workloads and further **refine** the database design.
 - **Internal** storage structures, file organizations, indexes, access paths, and **physical design parameters** for the database files specified

CSIE30600/CSIEB0290 Database Systems

ER Model 7

Overview of Database Design (4)

CSIE30600/CSIEB0290 Database Systems

ER Model 8

Design Alternatives

- In designing a database schema, we must ensure that we avoid two **major pitfalls**:
 - **Redundancy**: a bad design may result in repeat information.
 - Redundant representation of information may lead to data **inconsistency** among the various copies of information
 - **Incompleteness**: a bad design may make certain aspects of the enterprise difficult or impossible to model.
- Avoiding bad designs is not enough. There may be a large number of good designs from which we must choose.

Design Approaches

- **Entity Relationship Model** (covered in this lecture)
 - Models an enterprise as a collection of **entities** and **relationships**
 - **Entity**: a “thing” or “object” in the enterprise that is distinguishable from other objects
 - Described by a set of *attributes*
 - **Relationship**: an association among several entities
 - Represented diagrammatically by an **entity-relationship diagram**.
- **Map** the ER-diagram into a set of **relational schema**. (next lecture)
- **Normalization**: turn bad designs into good designs.

ER Model – Purpose and Basics

- **Entity/relationship (ER) model** provides a common, **informal**, and convenient method for communication between end users (customers) and the DB Administrator to **model** the **information structure**.
- A preliminary stage towards defining the database using a **formal model** (eg. relational model).
- The **ER model** and **ER diagrams** are pictorial descriptions to visualize information structure.
- ER models are surprisingly both **simple** and **powerful**.

CSIE30600/CSIEB0290 Database Systems

ER Model 11

ER Model – Purpose and Basics

- We will cover the ER model and most of the **Enhanced ER model**.
- ER model's concepts are standard.
- Several **varieties of pictorial representations** exist.
 - We will cover **Chen's** notations.
 - We will also cover some other notations.
- You can look at some examples at:
https://en.wikipedia.org/wiki/Entity-relationship_model

CSIE30600/CSIEB0290 Database Systems

ER Model 12

Example COMPANY Database

- We need to create a database schema design based on the following (simplified) **requirements** of the COMPANY Database:
 - The company is organized into **DEPARTMENTs**. Each department has a name, number and an employee who *manages* the department. We keep track of the start date of the department manager. A department may have several locations.
 - Each department *controls* a number of **PROJECTs**. Each project has a unique name, unique number and is located at a single location.

CSIE30600/CSIEB0290 Database Systems

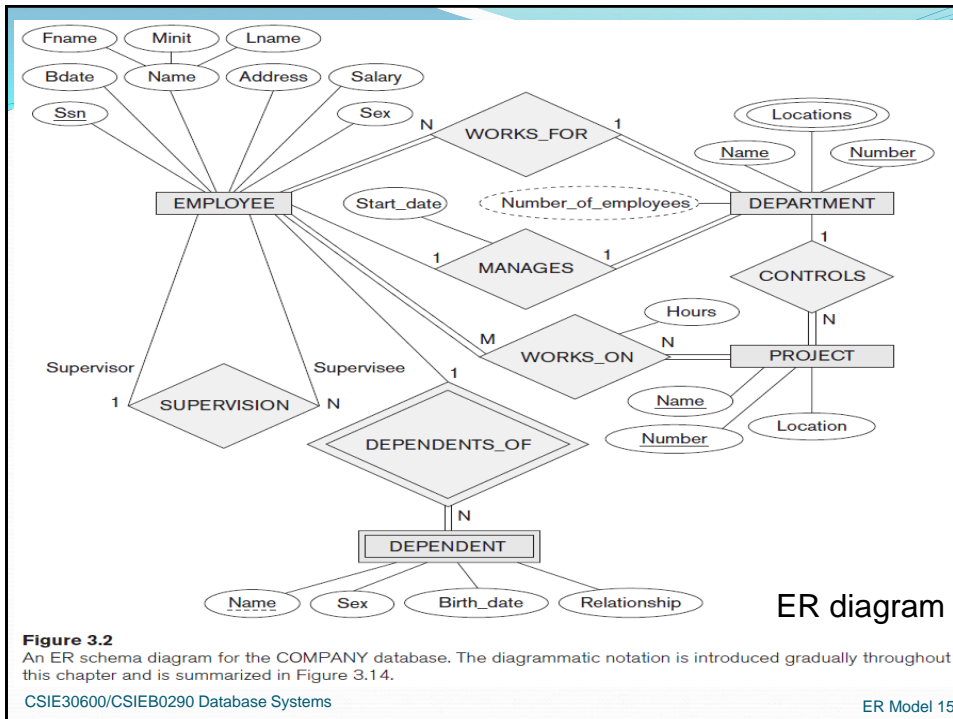

ER Model 13

COMPANY Database (Contd.)

- We store each **EMPLOYEE's** social security number, address, salary, sex, and birthday.
 - Each employee *works for* one department but may *work on* several projects.
 - We keep track of the number of hours per week that an employee currently works on each project.
 - We also keep track of the *direct supervisor* of each employee.
- Each employee may *have* a number of **DEPENDENTs**.
 - For each dependent, we keep track of their name, sex, birthday, and relationship to the employee.

CSIE30600/CSIEB0290 Database Systems

ER Model 14

Conceptual Modeling

- A **database** can be modeled as:
 - a collection of **entities**,
 - **relationship** among entities.
- An **entity** is an object that exists and is distinguishable from other objects.
 - Example: specific person, company, event, plant
- Entities have **attributes**
 - Example: people have *names* and *addresses*

Entities and Attributes

- **Entities** are specific objects or things in the mini-world that are represented in the database.
 - For example the EMPLOYEE John Smith, the Research DEPARTMENT, the ProductX PROJECT
- **Attributes** are properties used to describe an entity.
 - For example an EMPLOYEE entity may have the attributes Name, SSN, Address, Sex, BirthDate

CSIE30600/CSIEB0290 Database Systems

ER Model 17

Entities and Attributes

Figure 3.3
Two entities,
EMPLOYEE e_1 , and
COMPANY c_1 , and
their attributes.

CSIE30600/CSIEB0290 Database Systems

ER Model 18

Value and Value Set

- A specific entity will have a **value** for each of its attributes.
 - For example a specific employee entity may have Name='John Smith', SSN='123456789', Address='731, Fondren, Houston, TX', Sex='M', BirthDate='09-JAN-55'
 - **NULL** value
- Each attribute has a **value set** (or **data type**, **domain**) associated with it – e.g. integer, string, subrange, enumerated type, ...

Types of Attributes (1)

- **Simple**
 - Each entity has a single atomic value for the attribute. For example, SSN or Sex.
- **Composite**
 - The attribute may be composed of several components. For example:
 - Address(Apt#, House#, Street, City, State, ZipCode, Country), or
 - Name(FirstName, MiddleName, LastName).
 - Composition may form a hierarchy where some components are themselves composite.

Types of Attributes (2)

- **Multi-valued**
 - An entity may have multiple values for that attribute. For example, Color of a CAR or PreviousDegrees of a STUDENT.
 - Denoted as {Color} or {PreviousDegrees}.
- **Derived attributes**
 - Can be computed from other attributes. Example: age, given date_of_birth
- **Complex attributes**
 - Attributes with complex structure.

Types of Attributes (3)

- In general, composite and multi-valued attributes may be **nested** arbitrarily to any number of levels, although this is rare.
 - For example, PreviousDegrees of a STUDENT is a composite multi-valued attribute denoted by {PreviousDegrees (College, Year, Degree, Field)}
 - Multiple PreviousDegrees values can exist
 - Each has four subcomponent attributes:
 - College, Year, Degree, Field

Examples of Composite Attribute

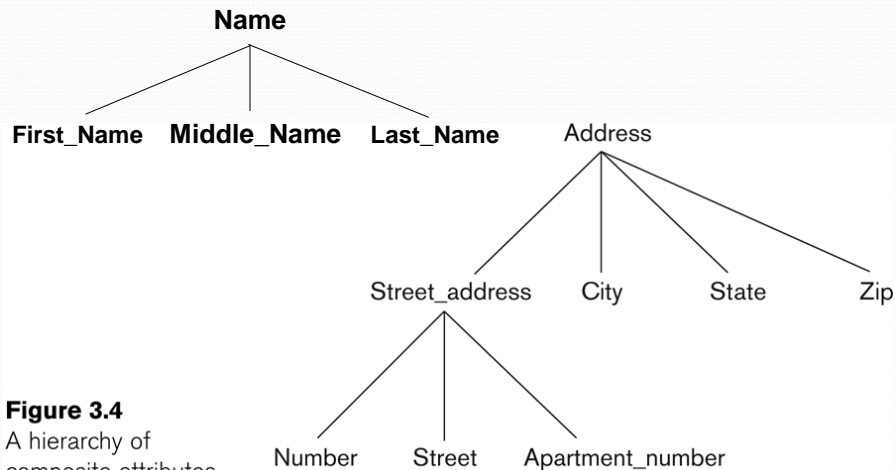

Figure 3.4
A hierarchy of composite attributes.

CSIE30600/CSIEB0290 Database Systems

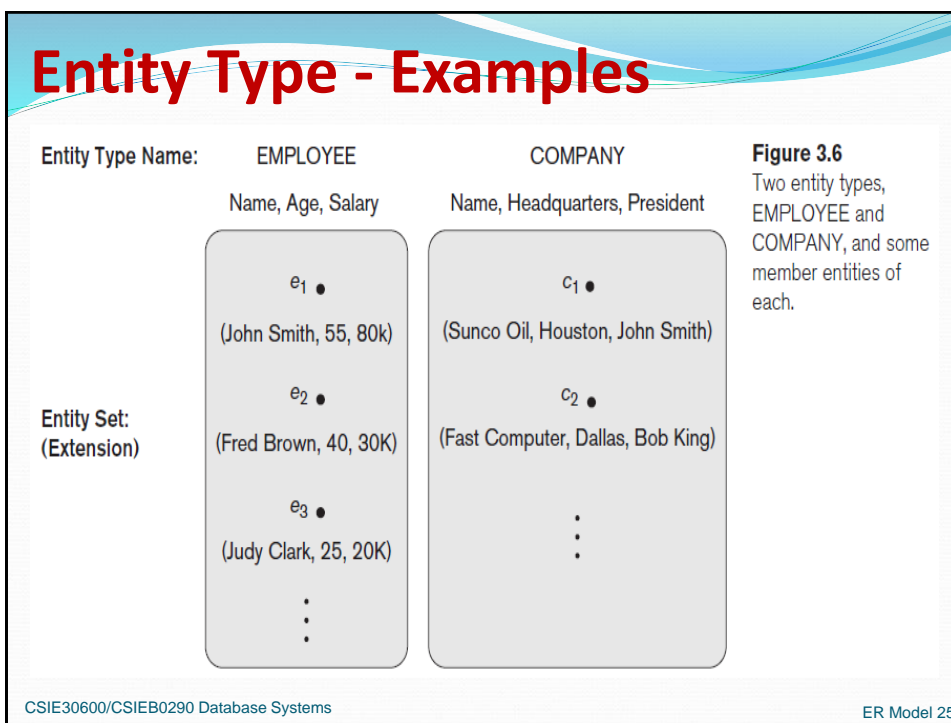

ER Model 23

Entity Types and Key Attributes (1)

- Entities with the same basic attributes are grouped or typed into an **entity type**.
 - For example, the entity type EMPLOYEE and COMPANY (next slide)
- A subset of attributes of an entity type for which each entity must have a **unique value** is called the **key attributes** of the entity type.
 - For example, SSN of EMPLOYEE.

CSIE30600/CSIEB0290 Database Systems

ER Model 24

Entity Types and Key Attributes (2)

- A key attribute may be **composite**.
 - VehicleTagNumber is a key of the CAR entity type with components (Number, State).
- An entity type may have more than one key.
 - The CAR entity type may have two keys:
 - VehicleIdentificationNumber (popularly called VIN)
 - VehicleTagNumber (Number, State), aka license plate number.
- Each key is underlined

CSIE30600/CSIEB0290 Database Systems ER Model 26

Keys

- Formally, a **super key** of an entity type is a set of **one or more attributes** whose values **uniquely determine** each entity.
- A **candidate key** of an entity set is a **minimal** super key
 - *Customer_id* is candidate key of *customer*
 - *account_number* is candidate key of *account*
- Although several candidate keys may exist, one of the candidate keys is selected to be the **primary key**.

CSIE30600/CSIEB0290 Database Systems

ER Model 27

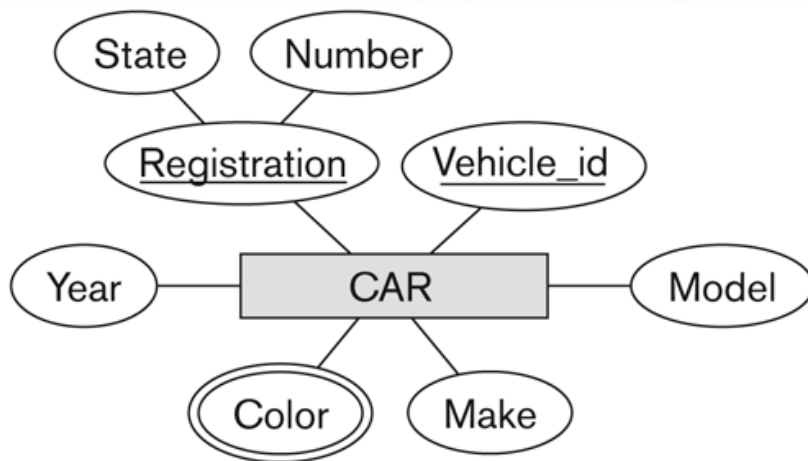

Displaying an Entity Type

- In ER diagrams, an entity type is displayed in a **rectangular box**
- Attributes are displayed in **ovals**
 - Each attribute is connected to its entity type
 - Components of a composite attribute are connected to the oval representing the composite attribute
 - Each **key** attribute is **underlined**
 - **Multivalued** attributes displayed in **double ovals**
- See CAR example on next slide

CSIE30600/CSIEB0290 Database Systems

ER Model 28

The CAR Entity Type

CSIE30600/CSIEB0290 Database Systems

ER Model 29

Different Notations Exist

- You will see ER diagram in many different notations.
- The basic concepts are the same.

<i>instructor</i>
<u><i>ID</i></u>
<i>name</i>
<i>salary</i>

<i>student</i>
<u><i>ID</i></u>
<i>name</i>
<i>tot_cred</i>

CSIE30600/CSIEB0290 Database Systems

ER Model 30

Entity Set

- Each entity type will have a **collection of entities** stored in the database (called the **entity set**).
- Next slide shows three CAR entity instances in the entity set for CAR
- Same name (CAR) used to refer to both the entity type and the entity set
- Entity set is the **current state** of the entities of that type that are stored in the database

CSIE30600/CSIEB0290 Database Systems

ER Model 31

The CAR Entity Set

CAR
Registration (Number, State), Vehicle_id, Make, Model, Year, {Color}

CAR₁
((ABC 123, TEXAS), TK629, Ford Mustang, convertible, 2004 {red, black})

CAR₂
((ABC 123, NEW YORK), WP9872, Nissan Maxima, 4-door, 2005, {blue})

CAR₃
((VSY 720, TEXAS), TD729, Chrysler LeBaron, 4-door, 2002, {white, blue})

⋮

CSIE30600/CSIEB0290 Database Systems

ER Model 32

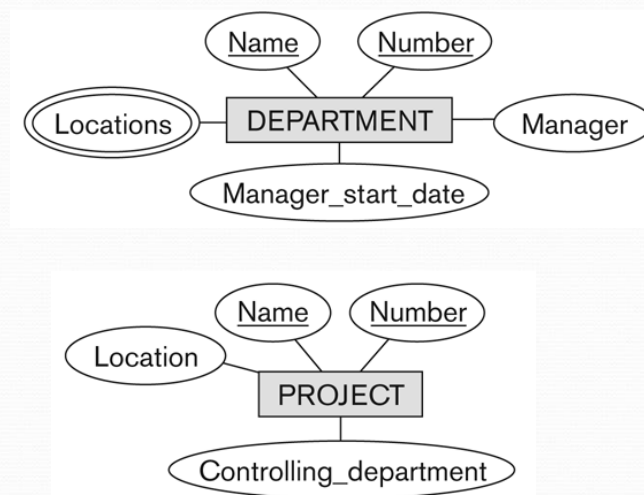

The COMPANY Database Schema

- Based on the requirements, we can identify four initial entity types in the COMPANY database:
 - DEPARTMENT
 - PROJECT
 - EMPLOYEE
 - DEPENDENT
- Initial design is shown on the following slide
- The initial attributes shown are derived from the requirements description

CSIE30600/CSIEB0290 Database Systems

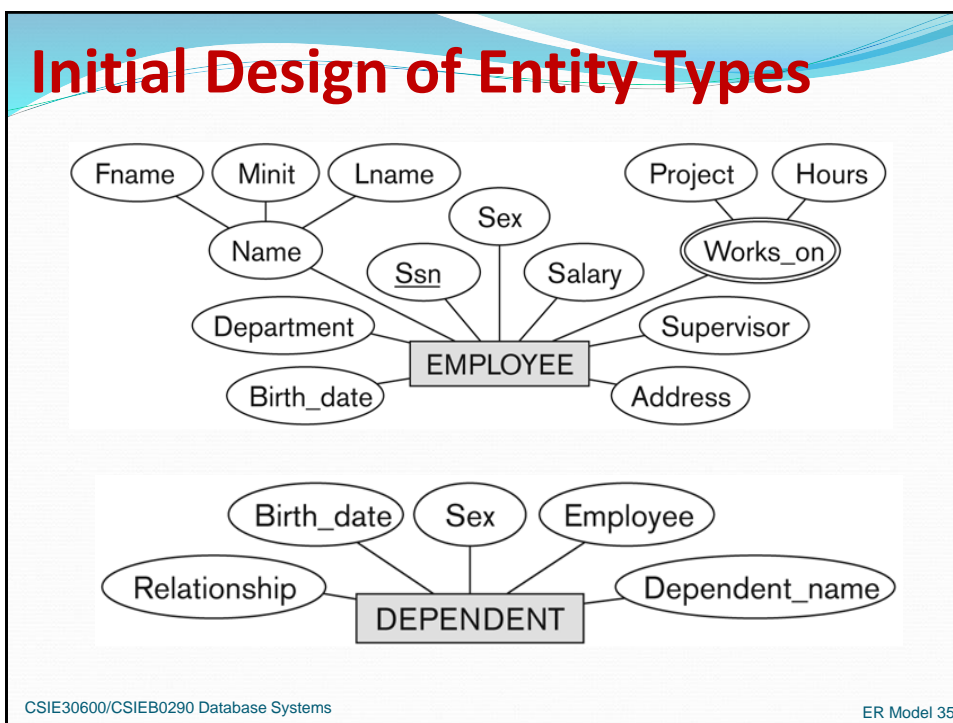

ER Model 33

Initial Design of Entity Types

CSIE30600/CSIEB0290 Database Systems

ER Model 34

Refining the Initial Design by Introducing Relationships

- The initial design is typically not complete
- Some aspects in the requirements will be represented as **relationships**
- ER model has three main concepts:
 - **Entities** (and their entity types and entity sets)
 - **Attributes** (simple, composite, multivalued)
 - **Relationships** (and their relationship types and relationship sets)
- We introduce relationship concepts next

CSIE30600/CSIEB0290 Database Systems ER Model 36

Relationships and Relationship Types

- A **relationship** relates two or more distinct entities with a specific meaning.
 - Eg, EMPLOYEE John Smith *works on* the ProductX PROJECT, or EMPLOYEE Franklin Wong *manages* the Research DEPARTMENT.
- Relationships of the same type are grouped or typed into a **relationship type**.
 - Eg, the WORKS_ON relationship type in which EMPLOYEEs and PROJECTs participate, or the MANAGES relationship type in which EMPLOYEEs and DEPARTMENTs participate.
- The **degree** of a relationship type is the number of participating entity types.
 - Both MANAGES and WORKS_ON are *binary* relationships.

CSIE30600/CSIEB0290 Database Systems

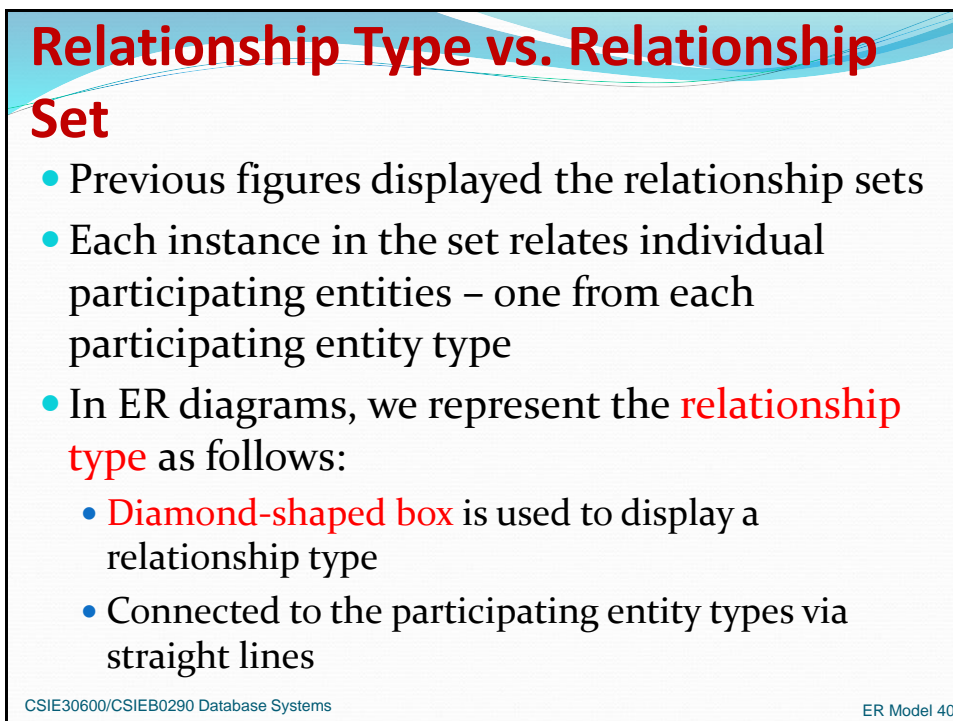

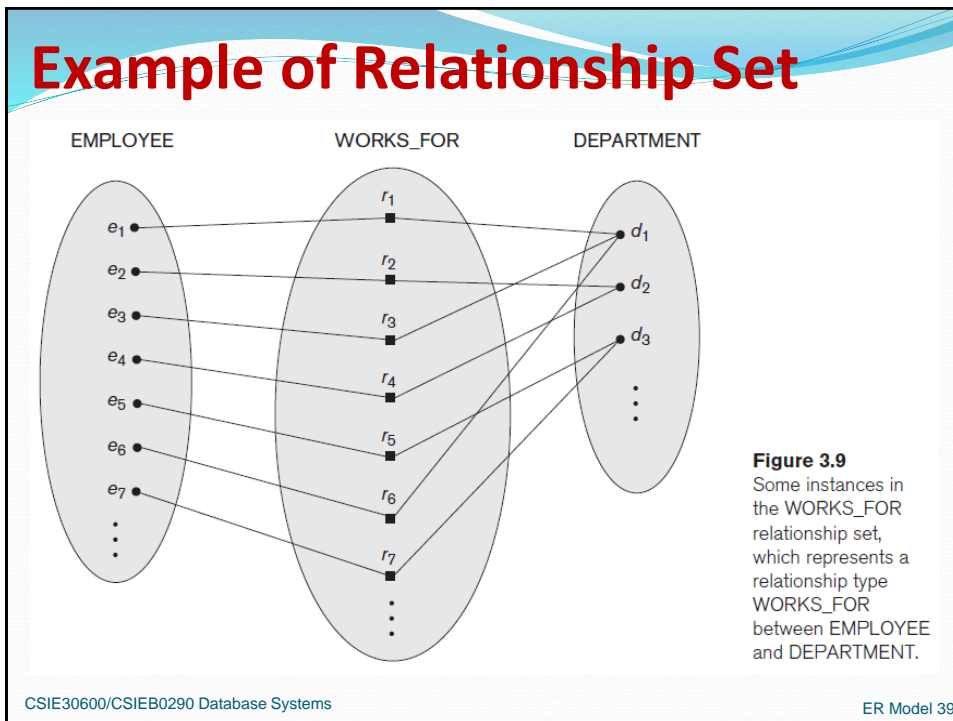

ER Model 37

Relationship Type vs. Relationship Set

- **Relationship Type:**
 - The **schema description** of a relationship
 - Identifies the relationship name and the participating entity types
 - Also identifies certain relationship constraints
- **Relationship Set:**
 - The current set of relationship instances represented in the database
 - The current *state* of a relationship type

CSIE30600/CSIEB0290 Database Systems

ER Model 38

Example of Relationship Type

CSIE30600/CSIEB0290 Database Systems

ER Model 41

Different Notation for Relationship Type

- Diamonds are commonly used.

CSIE30600/CSIEB0290 Database Systems

ER Model 42

Refining the COMPANY Database Schema

- By examining the requirements, **six relationship types** are identified
- All are *binary* relationships(degree 2)
- Listed below with their participating entity types:
 - WORKS_FOR (between EMPLOYEE, DEPARTMENT)
 - MANAGES (also between EMPLOYEE, DEPARTMENT)
 - CONTROLS (between DEPARTMENT, PROJECT)
 - WORKS_ON (between EMPLOYEE, PROJECT)
 - SUPERVISION (between EMPLOYEE (as subordinate), EMPLOYEE (as supervisor))
 - DEPENDENTS_OF (between EMPLOYEE, DEPENDENT)

CSIE30600/CSIEB0290 Database Systems

ER Model 43

Relationship Set (Binary)

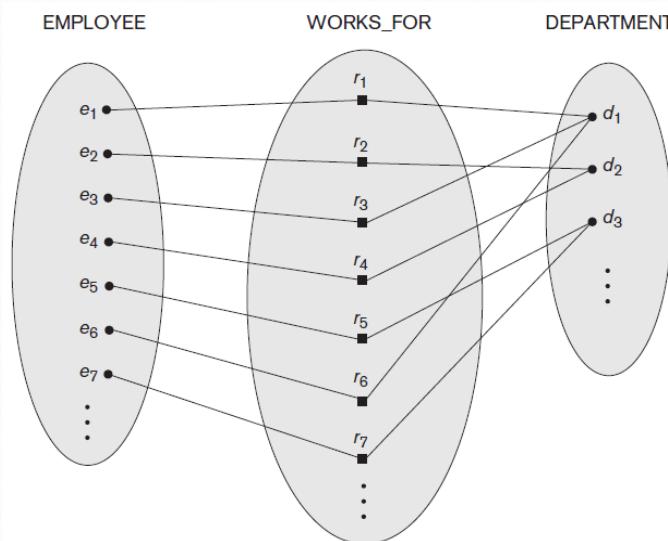

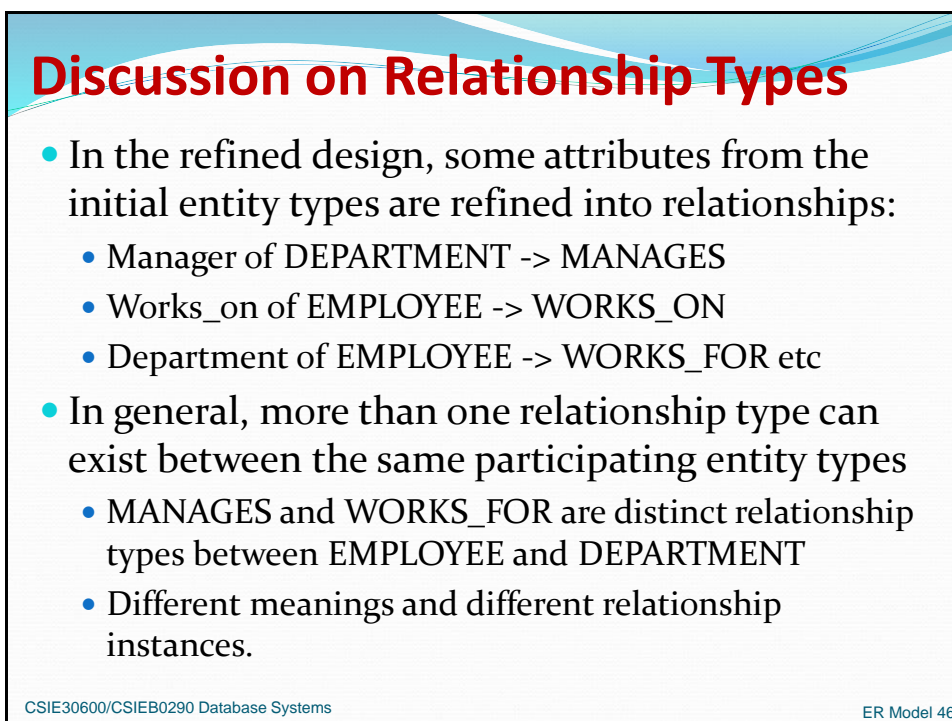

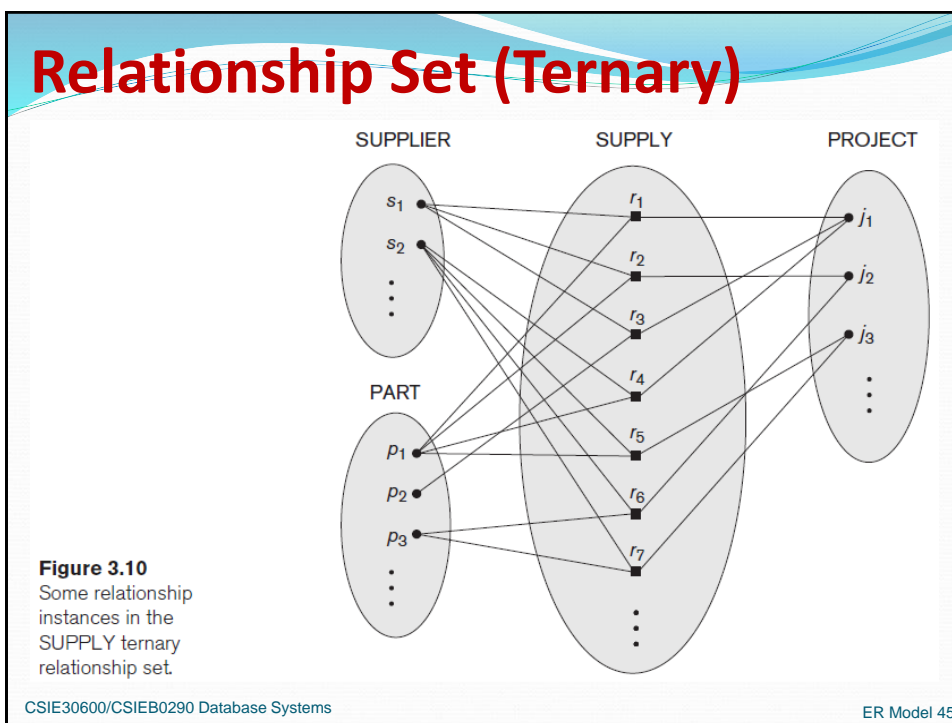

Figure 3.9

Some instances in the WORKS_FOR relationship set, which represents a relationship type WORKS_FOR between EMPLOYEE and DEPARTMENT.

CSIE30600/CSIEB0290 Database Systems

ER Model 44

Recursive Relationship Type

- A relationship type associating the same participating entity type in **distinct roles**
- Example: the SUPERVISION relationship
- EMPLOYEE participates twice in two distinct roles:
 - supervisor (or boss) role
 - supervisee (or subordinate) role
- Each relationship instance relates two distinct EMPLOYEE entities:
 - One employee in *supervisor* role
 - One employee in *supervisee* role

CSIE30600/CSIEB0290 Database Systems

ER Model 47

Recursive Relationship

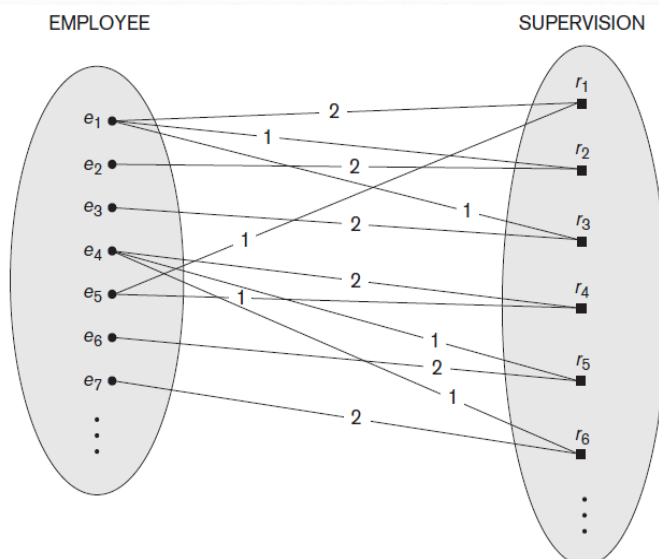

Figure 3.11

A recursive relationship SUPERVISION between EMPLOYEE in the *supervisor* role (1) and EMPLOYEE in the *subordinate* role (2).

CSIE30600/CSIEB0290 Database Systems

ER Model 48

Constraints on Relationship Types

- Also known as **ratio constraints**
- **Cardinality Ratio** (specifies *maximum* participation)
 - One-to-one (1:1)
 - One-to-many (1:N) or Many-to-one (N:1)
 - Many-to-many (M:N)
- **Existence Dependency Constraint** (specifies *minimum* participation) (also called **participation constraint**)
 - zero (optional participation, not existence-dependent)
 - one or more (mandatory participation, existence-dependent)

CSIE30600/CSIEB0290 Database Systems

ER Model 49

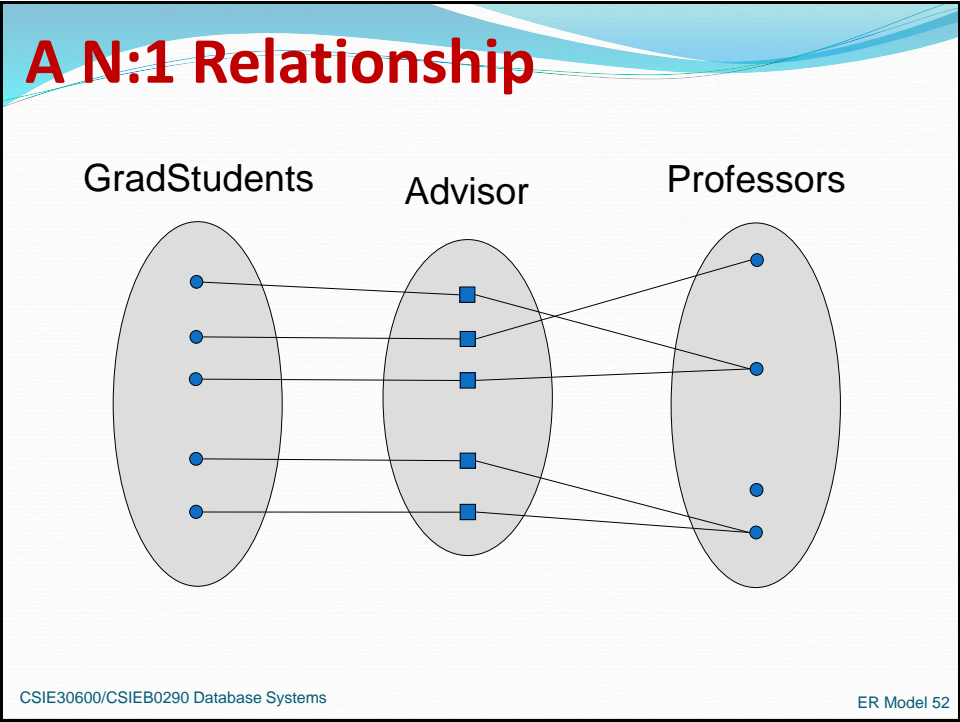

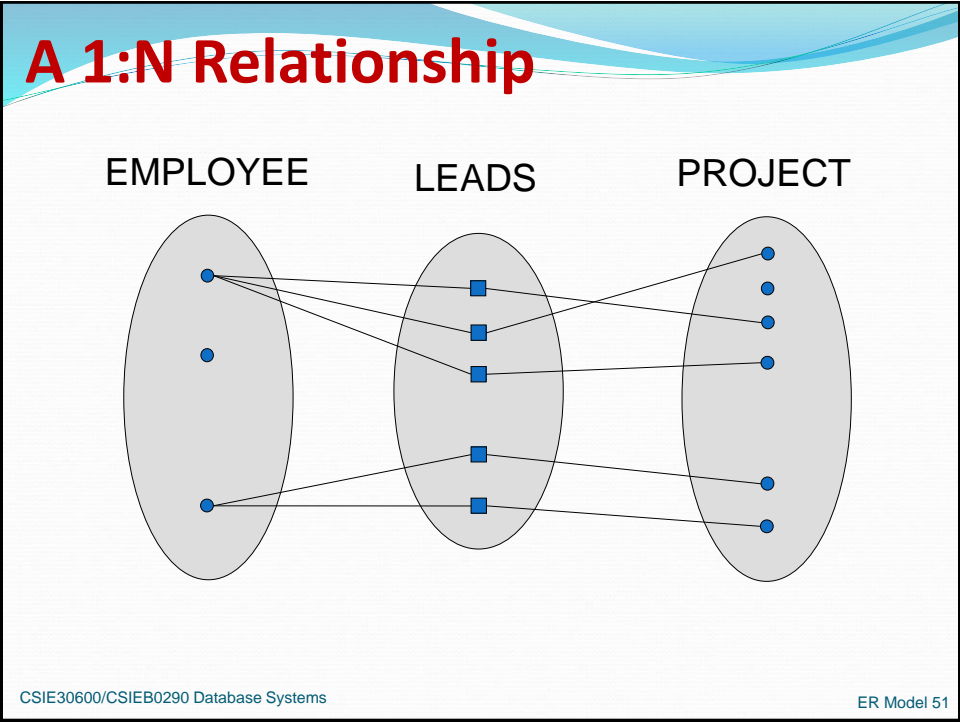

A 1:1 Relationship

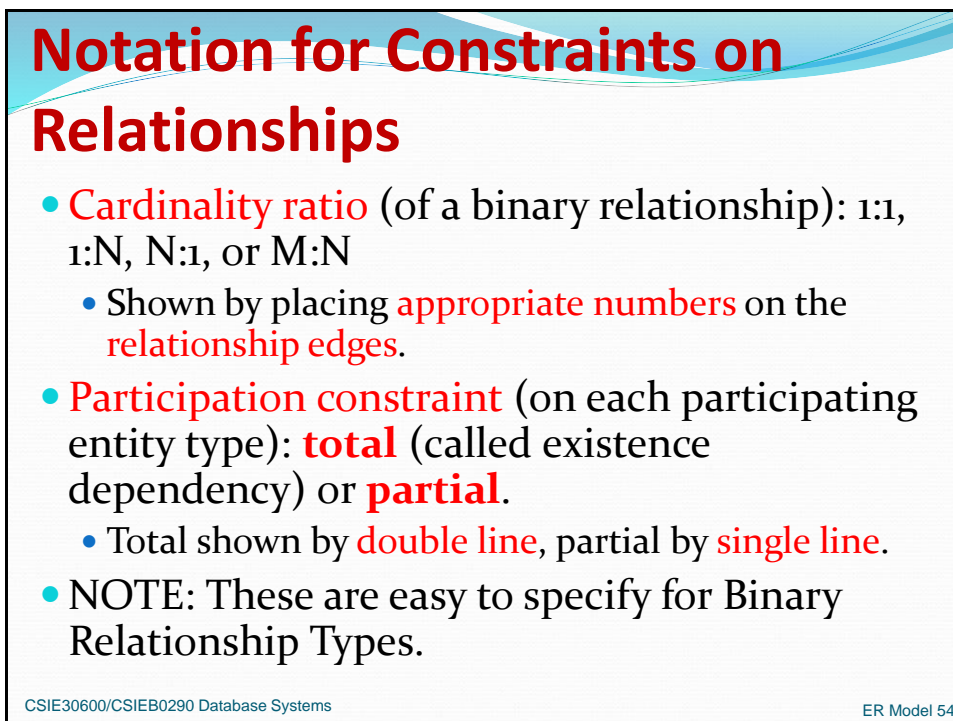

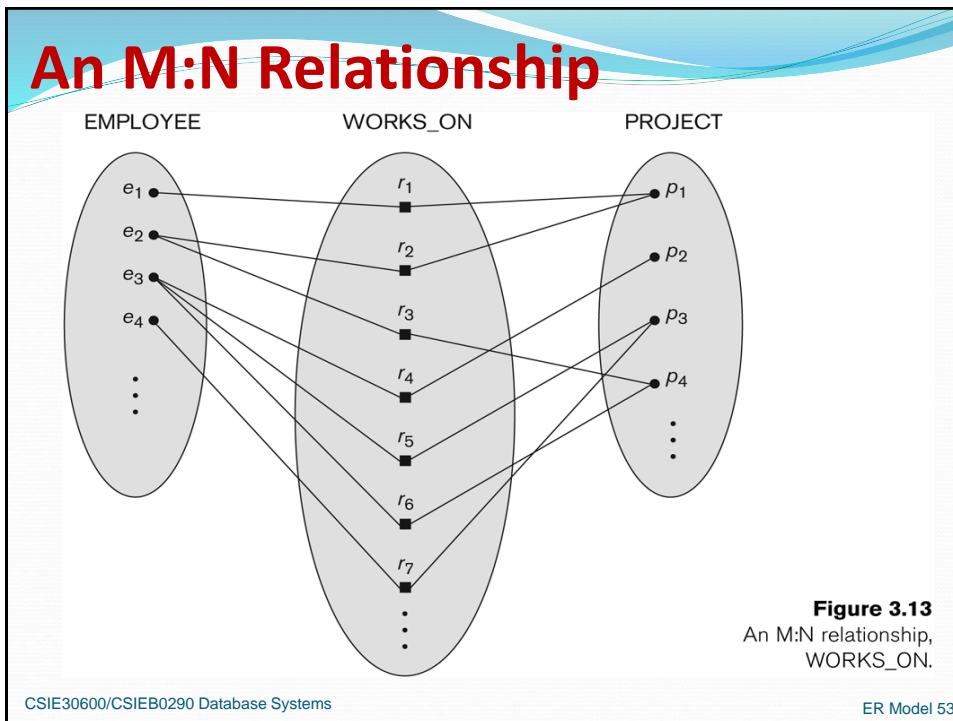

Figure 3.12
A 1:1 relationship,
MANAGES.

CSIE30600/CSIEB0290 Database Systems

ER Model 50

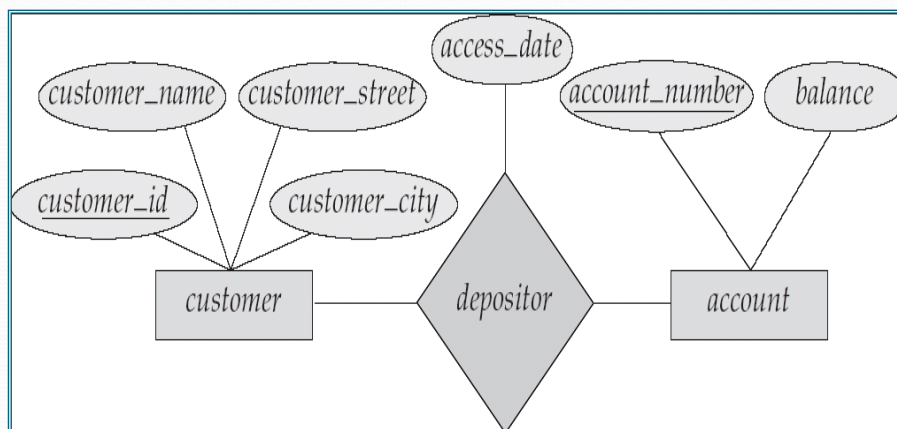

Attributes of Relationship Types

- A relationship type can have **attributes**:
 - For example, HoursPerWeek of WORKS_ON
 - Its value for each relationship instance describes the number of hours per week that an EMPLOYEE works on a PROJECT.
 - A value of HoursPerWeek depends on a particular (employee, project) combination
 - Most relationship attributes are used with M:N relationships

CSIE30600/CSIEB0290 Database Systems

ER Model 55

Relationship Type with Attributes

CSIE30600/CSIEB0290 Database Systems

ER Model 56

Attributes of Relationship Types

- Attributes of 1:1 relationship type can be migrated to one entity type
- For a 1:N relationship type
 - Relationship attribute can be migrated only to entity type on N-side of relationship
- For M:N relationship types
 - Some attributes may be determined by combination of participating entities
 - Must be specified as relationship attributes

CSIE30600/CSIEB0290 Database Systems

ER Model 57

Challenge Questions

- Can we instead place “since” in the Job entity?
- Or place “since” in the Employee entity?

CSIE30600/CSIEB0290 Database Systems

ER Model 58

Challenge Question

- The many-to-one relationship *Manages* states that a department have *at most one manager*, it may have no manager.
- What happens if *Departments* has total participation in *Manages*?

CSIE30600/CSIEB0290 Database Systems

ER Model 59

Roles

- Entity sets of a relationship need not be distinct
- Each occurrence of an entity set plays a “**role**” in the relationship
- The labels “*course_id*” and “*prereq_id*” are called roles.

CSIE30600/CSIEB0290 Database Systems

ER Model 60

Relationships – more formally

- **Relationship Set**: Collection of similar relationships
 - An n-ary relationship set R relates n entity sets E_1, \dots, E_n
 $\{ (e_1, e_2, \dots, e_n) \mid e_1 \in E_1, \dots, e_n \in E_n \}$,
where (e_1, e_2, \dots, e_n) is a **relationship**
 - $(\text{John}, \text{Pharmacy}) \in \text{Works_in}$
 - $\text{Works_in}(\text{John}, \text{Pharmacy})$

Weak Entity Types (1)

- An entity that **does not** have a key attribute
- A weak entity must participate in an **identifying relationship type** with an **owner** or **identifying entity type**
- Entities are identified by the combination of:
 - A **partial key** of the weak entity type
 - The particular **entity** they are related to in the identifying entity type
- Always has a **total participation** constraint

Weak Entity Types (2)

- Example:
 - A DEPENDENT entity is identified by the dependent's first name, *and* the specific EMPLOYEE with whom the dependent is related
 - Name of DEPENDENT is the *partial key*
 - DEPENDENT is a *weak entity type*
 - EMPLOYEE is its identifying entity type via the identifying relationship type DEPENDENT_OF

CSIE30600/CSIEB0290 Database Systems

ER Model 63

Weak Entity Set - Example

- What is the primary key for *payment*?

CSIE30600/CSIEB0290 Database Systems

ER Model 64

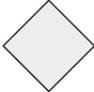

Strong vs. Weak Entity Sets

- **Strong** entity set:
 - Has sufficient attributes to form a primary key
- **Weak** entity set:
 - Lacks sufficient attributes to form a primary key
 - Hence, lacks sufficient attributes to form *any* key
- But every entity set needs a key; What to do?
 - Must *import attributes* from strong entity set(s)
 - A weak entity set member is subordinate to the owner entity from strong entity set providing attributes to complete its key

CSIE30600/CSIEB0290 Database Systems

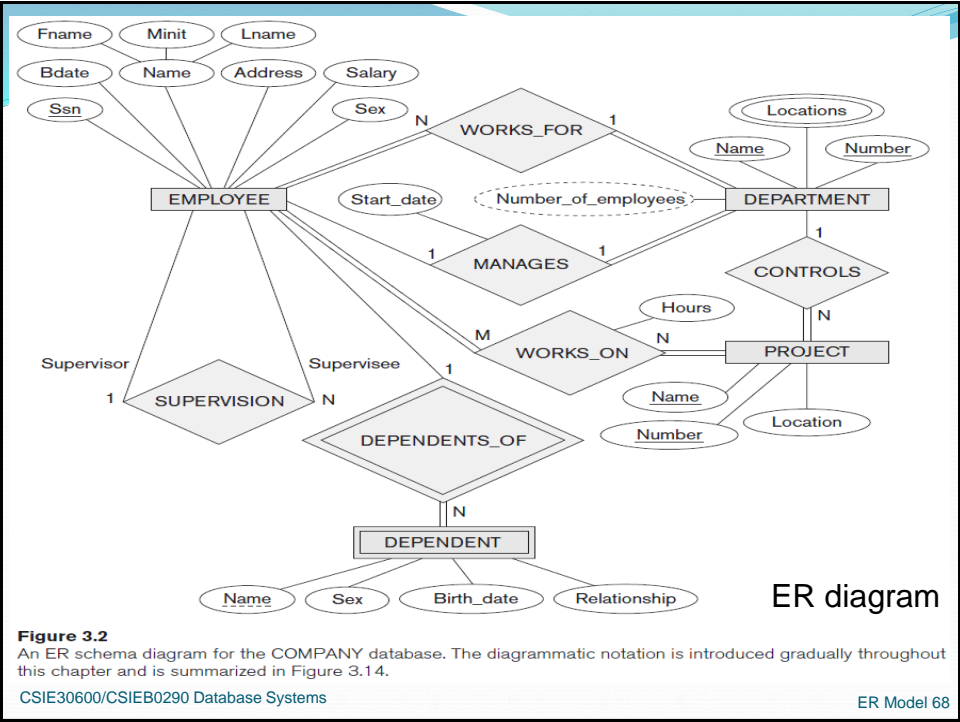

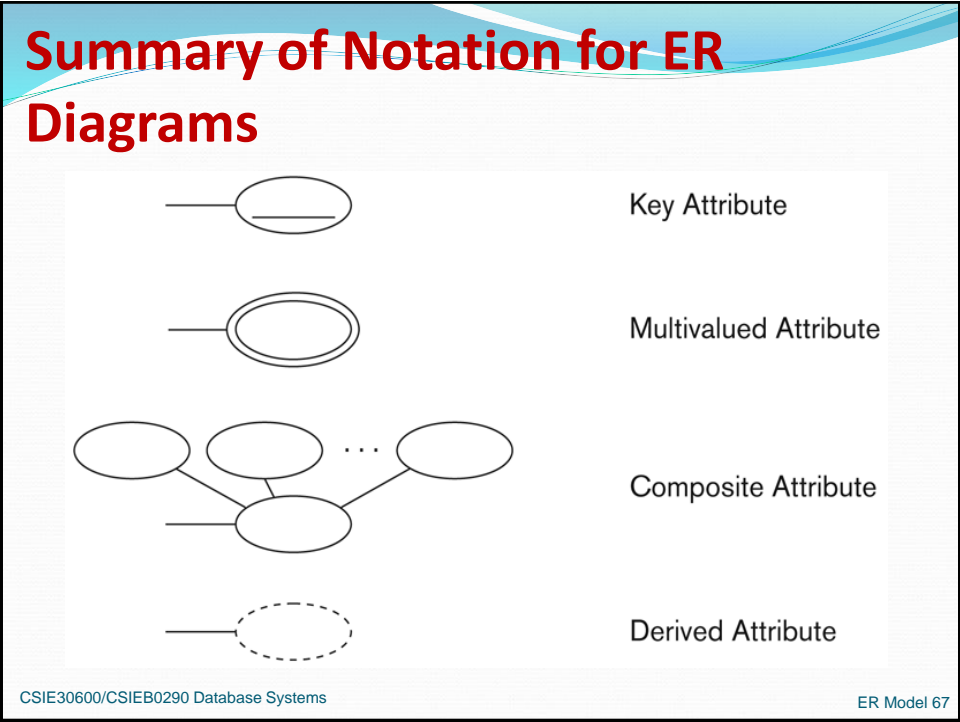

ER Model 65

Summary of Notation for ER Diagrams

Symbol	Meaning
	Entity
	Weak Entity
	Relationship
	Identifying Relationship
	Attribute

CSIE30600/CSIEB0290 Database Systems

ER Model 66

Alternative (min, max) Notation

- Specified on each participation of an entity type E in a relationship type R
- Specifies that each entity e in E participates in at least *min* and at most *max* relationship instances in R
- Default(no constraint): $\text{min}=0$, $\text{max}=\infty$ (signifying no limit)
- Must have $\text{min} \leq \text{max}$, $\text{min} \geq 0$, $\text{max} \geq 1$
- Derived from the knowledge of mini-world constraints

CSIE30600/CSIEB0290 Database Systems

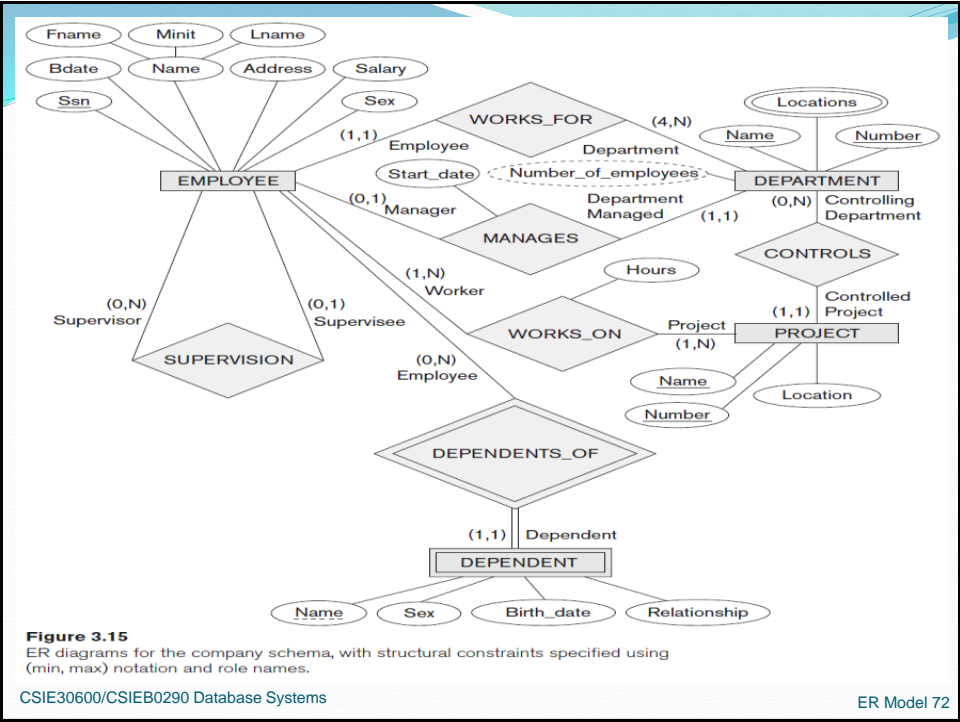

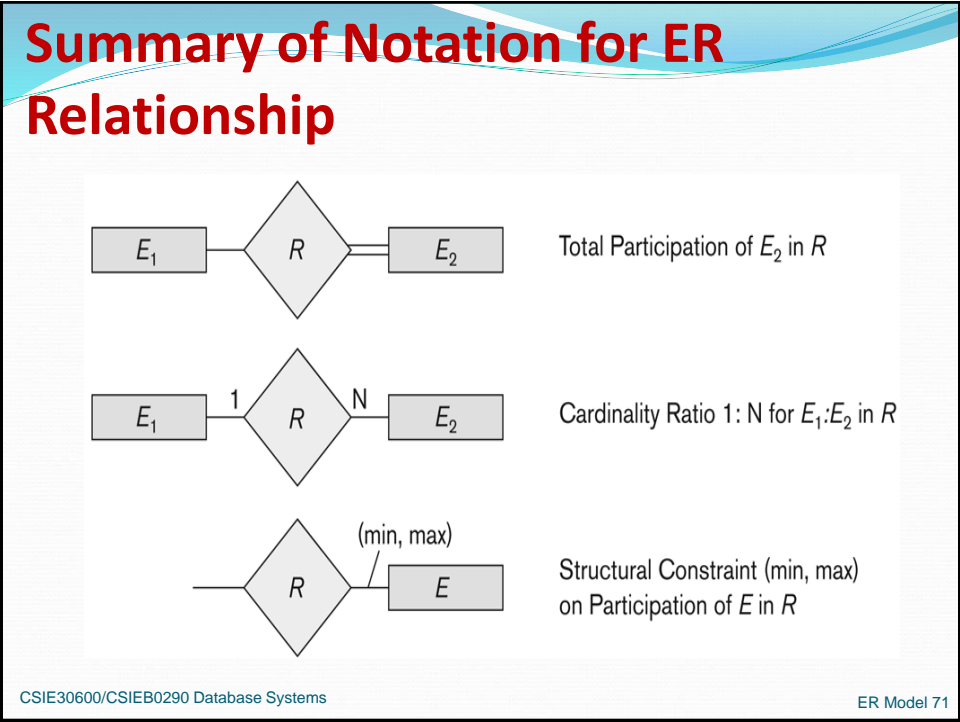

ER Model 69

Alternative (min, max) Notation - Examples

- A department has exactly one manager and an employee can manage at most one department.
 - Specify (0,1) for participation of EMPLOYEE in MANAGES
 - Specify (1,1) for participation of DEPARTMENT in MANAGES
- An employee can work for exactly one department but a department can have any number of employees.
 - Specify (1,1) for participation of EMPLOYEE in WORKS_FOR
 - Specify (0,n) for participation of DEPARTMENT in WORKS_FOR

CSIE30600/CSIEB0290 Database Systems

ER Model 70

Take Home Exercise

- Conduct an ER design after class.
- May use any application of your choice to be modeled.
- No need to turn in anything.

Alternative Diagrammatic Notation

- ER diagrams is one popular example for displaying database schemas
- Many other notations exist in the literature and in various database design and modeling tools
- **UML class diagrams** is representative of another way of displaying ER concepts that is used in several commercial design tools

Example of Other Notation:

UML Class Diagrams

- UML(Unified Modeling Language) methodology
 - Used extensively in **software design**
 - Many types of diagrams for various software design purposes
- UML **class diagrams**
 - Entity in ER corresponds to an **object** in UML

UML Class Diagrams

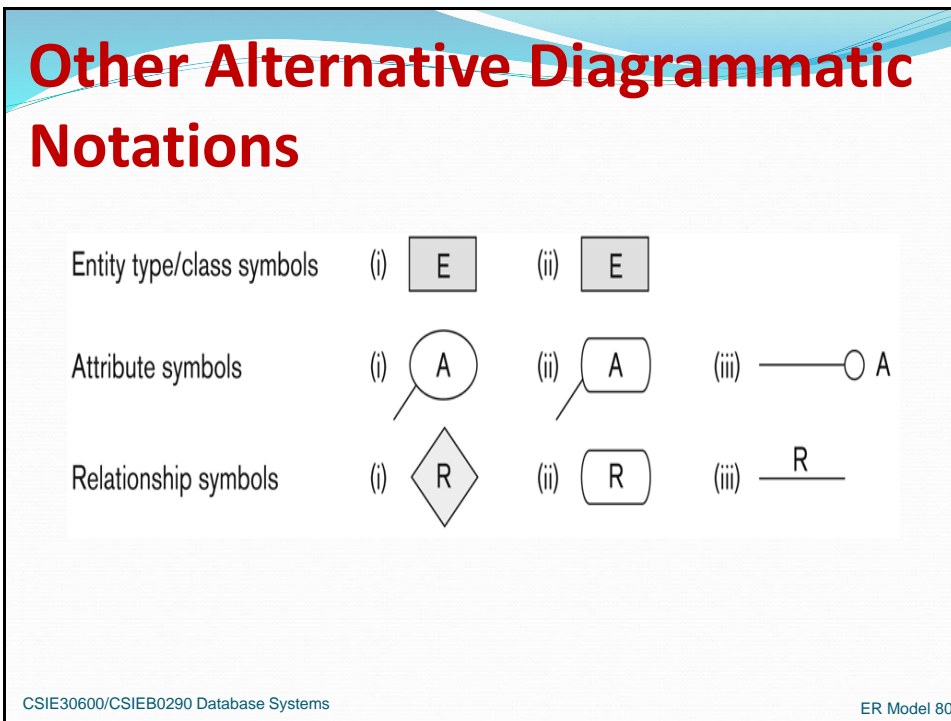

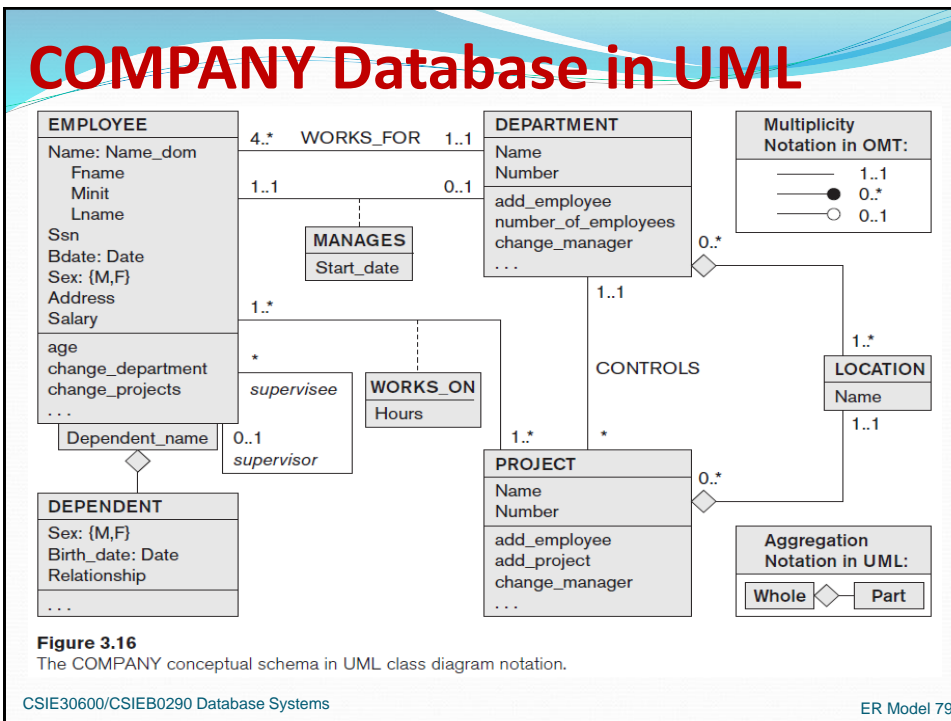

- Represent **classes** (similar to entity types) as large **rounded boxes** with three sections:
 - Top section includes the **entity type** (class) name
 - Middle section includes the **attributes**
 - Last section includes **class operations** that can be applied to individual objects (operations are not in basic ER model)
- Relationships (called **associations**) represented as **lines** connecting the classes
- Relationship instances: links

UML Class Diagrams

- **Binary association**
 - Represented as a **line** connecting participating classes
 - May optionally have a **name**
- **Link attribute**
 - Placed in a **box** connected to the association's line by a **dashed line**
- **Multiplicities**: min..max, asterisk (*) indicates no maximum limit on participation

UML Class Diagrams

- Types of relationships: **association** and **aggregation**
- Distinguish between **unidirectional** and **bidirectional** associations
- Model weak entities using **qualified association**
- UML: used in database design and object-oriented software design
- UML has many other types of diagrams for software design

Other Alternative Diagrammatic Notations

CSIE30600/CSIEB0290 Database Systems
ER Model 82

Other Alternative Diagrammatic Notations

CSIE30600/CSIEB0290 Database Systems

ER Model 83

Relationships of Higher Degree

- Relationship types of degree 2 are called **binary**
- Relationship types of degree 3 are called **ternary** and of degree n are called **n-ary**
- In general, an n-ary relationship is NOT equivalent to n binary relationships
- Constraints are harder to specify for higher-degree relationships ($n > 2$) than for binary relationships

CSIE30600/CSIEB0290 Database Systems

ER Model 84

Discussion n-ary Relationships ($n > 2$)

- In general, 3 binary relationships can represent different information than a single ternary relationship (see Figure 3.17a and b on next slide)
- If needed, the binary and n-ary relationships can all be included in the schema design (see Figure 3.17a and b, where all relationships convey different meanings)
- In some cases, a ternary relationship can be represented as a **weak entity** if the data model allows a weak entity type to have multiple identifying relationships (and hence multiple owner entity types) (see Figure 3.17c)

CSIE30600/CSIEB0290 Database Systems

ER Model 85

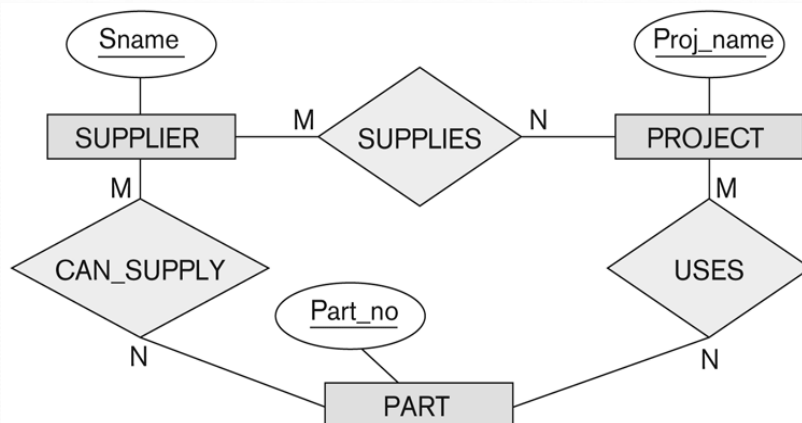

Example of a Ternary Relationship

CSIE30600/CSIEB0290 Database Systems

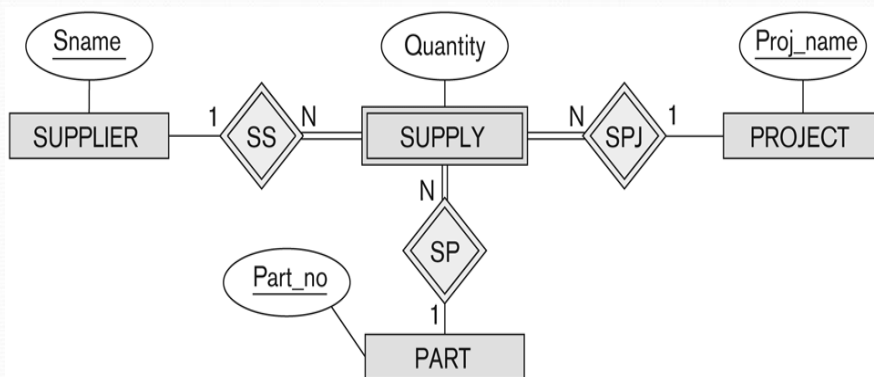

ER Model 86

Ternary to Binary

Not equivalent to SUPPLY. Why ?

Ternary as Weak Entity Type

SUPPLY represented as a **weak entity type**.

Discussion of n-ary Relationships ($n > 2$)

- If a particular binary relationship can be derived from a higher-degree relationship at all times, then it is **redundant**
- For example, the TAUGHT_DURING binary relationship in Figure 3.18 (see next slide) can be derived from the ternary relationship OFFERS (based on the meaning of the relationships)

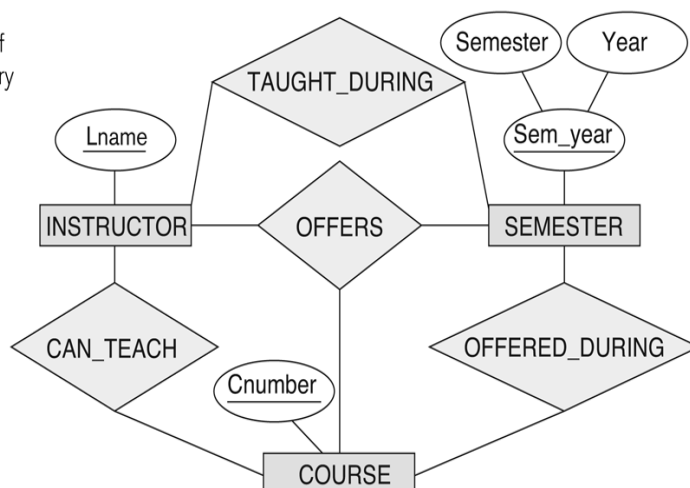

CSIE30600/CSIEB0290 Database Systems

ER Model 89

Another Example of a Ternary Relationship

Figure 3.18

Another example of ternary versus binary relationship types.

CSIE30600/CSIEB0290 Database Systems

ER Model 90

Displaying Constraints on Higher-degree Relationships

- The (min, max) constraints can be displayed on the edges – however, they do not fully describe the constraints
- Displaying a 1, M, or N indicates additional constraints
 - An M or N indicates no constraint
 - A 1 indicates that an entity can participate in **at most one** relationship instance that has a particular combination of the other participating entities
- In general, both (min, max) and 1, M, or N are needed to describe fully the constraints

CSIE30600/CSIEB0290 Database Systems

ER Model 91

Data Modeling Tools

- A number of popular **tools** that cover conceptual modeling and mapping into relational schema design.
 - Examples: (next slide)
- **POSITIVES:**
 - Serves as documentation of application requirements, easy user interface - mostly graphics editor support
- **NEGATIVES:**
 - Most tools do not support the full set of modeling concepts.

CSIE30600/CSIEB0290 Database Systems

ER Model 92

Database Design/Modeling Tools

- Many database design/modeling tools
- Visual design tools are easy to use
- Some references
 - Comparison of data modeling tools (https://en.wikipedia.org/wiki/Comparison_of_data_modeling_tools)
 - Database Tools Catalog (<https://dbmstools.com/>)
 - Design Tools (https://wiki.postgresql.org/wiki/Design_Tools)

Extended Entity-Relationship (EER) Model

- The entity relationship model in its original form did not support the **specialization** and **generalization** abstractions
- Next chapter illustrates how the ER model can be extended with
 - **Type-subtype** and **set-subset** relationships
 - **Specialization/Generalization** Hierarchies
 - Notation to display them in **EER diagrams**

Summary

- ER Model Concepts: Entities, attributes, relationships
- Constraints in the ER model
- Using ER in step-by-step conceptual schema design for the COMPANY database
- ER Diagrams - Notation
- Alternative Notations – UML class diagrams, others
