

CSIE30600/CSIEB0290 Database Systems

Lecture 5: Basic SQL

Outline

- SQL Data Definition and Data Types
- Specifying Constraints in SQL
- Basic Retrieval Queries in SQL
- INSERT, DELETE, and UPDATE Statements
- Additional Features of SQL
- Cover basic SQL so that you can use DBMS immediately.

SIE30600/CSIEB0290 Database System

Basic SQL

- SQL language is considered one of the major reasons for the commercial success of relational databases.
- SQL
 - Structured Query Language
 - Statements for data definitions, queries, and updates (both DDL and DML)
 - Core specification
 - Plus specialized extensions
- Online resources:
 - SQL Wikipedia(https://en.wikipedia.org/wiki/SQL)
 - SQL Tutorial(https://www.w3schools.com/sql/)

SIE30600/CSIEB0290 Database Systems

Basic SQL 3

What is SQL?

Data manipulation: ad-hoc queries and updates

SELECT *
FROM Account
WHERE Type = "checking";

Data definition: creation of tables and views

CREATE TABLE Account
(Number integer NOT NULL,
Owner character,
Balance currency,
Type character,
PRIMARY KEY (Number));

• Control: assertions to protect data integrity

CHECK (Owner IS NOT NULL)

SIE30600/CSIEB0290 Database Systems

History of SQL

- IBM Sequel (Structured English Query Language) developed as part of System R at the IBM San Jose Research Lab
- Renamed Structured Query Language (SQL)
- · ANSI and ISO standard SQL:
 - SQL-86, SQL-89, SQL-92 (SQL2)
 - SQL:1999 (SQL3, language name became Y2K compliant!)
 - SQL:2003, 2006 (add XML)
 - SQL:2008 (new statements and better integration with XML)
 - SQL:2011 (add temporal database features)
 - SQL:2016 (add row pattern matching, JSON, etc.)
- Commercial systems may not offer the complete set of features of the standard. May also provide proprietary functions.
- Correctly pronounced "es cue ell", not "sequel"!

SIE30600/CSIEB0290 Database Systems

Basic SQL 5

SQL is a Declarative Language

- A procedural (imperative) language describes how to perform some task:
 - relational algebra
 - "project(Iname, join(EMPLOYEE, DEP, ssn == essn)))"
- A declarative language describes what the results are like not how to create it
 - HTML, latex, SQL, tuple relational calculus
 - "The set of all last names of employees such that the SSN of that employee is the ESSN of at least one member of the dependent relation"

CSIE30600/CSIEB0290 Database Systems

SQL has multiple roles

- Data definition language (DDL)
 - Eg, define relation schemas, specify integrity constraints
- Data control language (DCL)
 - Eg, security and authorization controls
- Data manipulation language (DML)
 - Query for tuples
 - Insert, delete and modify tuples
- SQL supports constraints, transactions, views & triggers
- New SQL even supports XML, temporal DB and JSON

SIE30600/CSIEB0290 Database Systems

Basic SQL

Data Definition Language

- Allows the specification of not only a set of relations but also information about each relation, including:
 - The schema for each relation.
 - The domain of values associated with each attribute.
 - Integrity constraints
 - The set of indices to be maintained for each relations.
 - Security and authorization information for each relation.
 - The physical storage structure of each relation on disk.
- SQL is case insensitive.

SIE30600/CSIEB0290 Database Systems

SQL Data Definition and Data Types

- Terminology:
 - Table, row, and column used for relational model terms relation, tuple, and attribute
- CREATE statement
 - Main SQL command for data definition

IE30600/CSIEB0290 Database Systems

Basic SQL 9

Create Schema

- CREATE SCHEMA <db name>
 - creates a DB with the given name
- called CREATE DATABASE in MySQL
- example:
 - CREATE SCHEMA testDB;
- Each statement in SQL ends with a semicolon

CSIE30600/CSIEB0290 Database Systems

Schema and Catalog

- SQL schema
 - Identified by a schema name
 - Includes an authorization identifier and descriptors for each element
- Schema elements include
 - Tables, constraints, views, domains, and other constructs
- Catalog
 - Named collection of schemas in an SQL environment
- SQL environment
 - Installation of an SQL-compliant RDBMS on a computer system

SIE30600/CSIEB0290 Database Systems

Basic SQL 11

Create Table

An SQL relation is defined using the CREATE TABLE command:

```
CREATE TABLE r (A_1 D_1, A_2 D_2, ..., A_n D_n, (integrity-constraint<sub>1</sub>), ..., (integrity-constraint<sub>k</sub>));
```

- -r is the name of the relation
- each A_i is an attribute name in the schema of relation r
- $-D_i$ is the data type of values in the domain of attribute A_i
- Example:

```
CREATE TABLE branch
(branch_name char(15) not null,
branch_city char(30),
assets integer);
```

CSIE30600/CSIEB0290 Database System

Domain Types in SQL

- varchar(n). Variable length character strings, with userspecified maximum length n.
- int. Integer (a finite subset of the integers that is machine-dependent).
- smallint. Small integer (a machine-dependent subset of the integer domain type).
- numeric(p,s). Fixed point number, with user-specified precision of p digits, with s digits to the right of decimal point.
- real, double precision. Floating point and doubleprecision floating point numbers, with machinedependent precision.

SIE30600/CSIEB0290 Database Systems

Basic SQL 13

Domain Types in SQL (cont.)

- float(n). Floating point number, with user-specified precision of at least n digits.
- Bit-string data types
 - Fixed length: BIT (n)
 - Varying length: BIT VARYING (n)
- Boolean data type
 - Values of TRUE or FALSE or NULL
- DATE data type
 - Ten positions
 - Components are YEAR, MONTH, and DAY in the form YYYY-MM-DD

SIE30600/CSIEB0290 Database Systems

Domain Types in SQL (cont.)

- Additional data types
 - Timestamp data type (TIMESTAMP)
 - Includes the DATE and TIME fields
 - Plus a minimum of six positions for decimal fractions of seconds
 - Optional AT TIME ZONE qualifier
 - INTERVAL data type
 - Specifies a relative value that can be used to increment or decrement an absolute value of a date, time, or timestamp
- More are covered in the book.

SIE30600/CSIEB0290 Database Systems

Basic SQL 15

Time Related Data Types

- Has DATE, TIME, and TIMESTAMP data types
 - DATE:
 - Made up of year-month-day in the format yyyy-mm-dd
 - TIME:
 - Made up of hour:minute:second in the format hh:mm:ss
 - TIME(i):
 - Made up of hour:minute:second plus i additional digits specifying fractions of a second
 - format is hh:mm:ss:ii...i

CSIE30600/CSIEB0290 Database System

Date and Time

- Special data types for dates and times
- Date constant represented by keyword DATE followed by a quoted string
 - E.g., DATE '1971-03-04'
 - SELECT * FROM Students

WHERE birth date < **DATE '1971-03-04'**

- Time constant represented by keyword TIME followed by a quoted string
 - E.g., TIME '17:00:02.5'

SIE30600/CSIEB0290 Database Systems

Basic SQL 17

Timestamp and Interval

- TIMESTAMP:
 - Has both DATE and TIME components
- INTERVAL:
 - Specifies a relative value rather than an absolute value
 - Can be DAY/TIME intervals or YEAR/MONTH intervals
 - Can be positive or negative when added to or subtracted from an absolute value, the result is an absolute value

SIE30600/CSIEB0290 Database Systems

Time Related Examples Type Stores Literal DATE 'YYYY-MM-DD' DATEyear, month, day TIME hour, minute, and second TIME 'HH:MM:SS' TIMESTAMP 'YYYY-MM-DD HH:MM:SS' **TIMESTAMP** year, month, day, hour, minute, and second **Example Literal** Description Type Year-Month INTERVAL '5' YEAR 5 years **INTERVAL** '2' MONTH 2 months INTERVAL '3-1' YEAR TO MONTH 3 years and 1 month Day-Time INTERVAL '5 10:30:22.5' DAY TO SECOND 5 days, 10 hours, 30 minutes, and 22.5 seconds INTERVAL '-5' DAY 5 days ago **INTERVAL** '2 18:00' DAY TO MINUTE 2 days and 18 minutes

CREATE TABLE

- Specifies a new base relation by giving it a name, and specifying each of its attributes and their data types (INTEGER, FLOAT, DECIMAL(i,j), CHAR(n), VARCHAR(n))
- A constraint NOT NULL may be specified on an attribute

```
CREATE TABLE DEPARTMENT (
Dname VARCHAR(10) NOT NULL,
Dnumber INTEGER NOT NULL,
MGRSSN CHAR(9),
MGRStartDate CHAR(9));
```

SIE30600/CSIEB0290 Database Systems

SIE30600/CSIEB0290 Database Systems

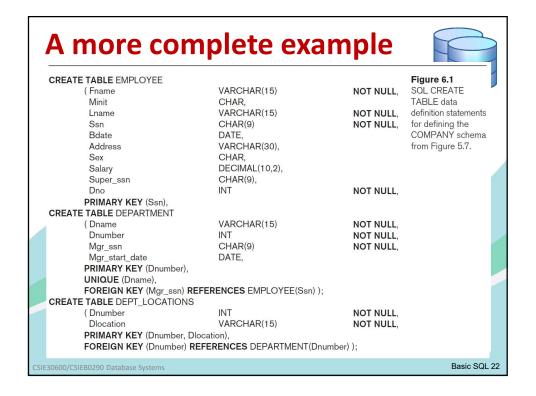

```
CREATE TABLE

    We can use the CREATE TABLE command for specifying the

  primary key attributes, secondary keys, and referential integrity
  constraints (foreign keys).

    Key attributes can be specified via the PRIMARY KEY and UNIQUE

  phrases
  CREATE TABLE DEPT (
     Dname
                   VARCHAR (10)
                                     NOT NULL,
     Dnumber
                   INTEGER
                                    NOT NULL,
     MGRSSN
                   CHAR (9),
    MGRStartDate CHAR(9),
     PRIMARY KEY (Dnumber),
     UNIQUE (Dname),
     FOREIGN KEY (MGRSSN) REFERENCES EMP
```

DOMAIN

- Name used with the attribute specification
- Makes it easier to change the data type for a domain that is used by numerous attributes
- · Improves schema readability
- Example:

CREATE DOMAIN SSN TYPE AS CHAR (9);

SIE30600/CSIEB0290 Database System

Specifying Constraints in SQL

- Basic constraints:
 - Key and referential integrity constraints
 - Restrictions on attribute domains and NULLs
 - Constraints on individual tuples within a relation

SIE30600/CSIEB0290 Database Systems

Basic SQL 25

Specifying Attribute Constraints and **Attribute Defaults**

- NOT NULL
 - NULL is not permitted for a particular attribute
- Default value
 - **DEFAULT** < value>
- **CHECK** clause
 - Dnumber INT NOT NULL CHECK (Dnumber
 > 0 AND Dnumber < 21);</pre>

SIE30600/CSIEB0290 Database Systems

```
CREATE TABLE EMPLOYEE
                          NOT NULL
    Dno
                                        DEFAULT 1,
   CONSTRAINT EMPPK
    PRIMARY KEY (Ssn),
   CONSTRAINT EMPSUPERFK
    FOREIGN KEY (Super_ssn) REFERENCES EMPLOYEE(Ssn)
                 ON DELETE SET NULL
                                          ON UPDATE CASCADE,
   CONSTRAINT EMPDEPTFK
    FOREIGN KEY(Dno) REFERENCES DEPARTMENT(Dnumber)
                 ON DELETE SET DEFAULT ON UPDATE CASCADE);
CREATE TABLE DEPARTMENT
    Mgr_ssn CHAR(9)
                          NOT NULL DEFAULT '888665555',
   CONSTRAINT DEPTPK
    PRIMARY KEY(Dnumber),
   CONSTRAINT DEPTSK
    UNIQUE (Dname),
   CONSTRAINT DEPTMGRFK
    FOREIGN KEY (Mgr_ssn) REFERENCES EMPLOYEE(Ssn)
                                                                      Figure 6.2
                 ON DELETE SET DEFAULT ON UPDATE CASCADE);
                                                                      Example illustrating
CREATE TABLE DEPT_LOCATIONS
                                                                      how default attribute
                                                                      values and referential
   PRIMARY KEY (Dnumber, Dlocation),
                                                                      integrity triggered
   FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber)
                                                                      actions are specified
                ON DELETE CASCADE
                                           ON UPDATE CASCADE);
                                                                      in SQL.
                                                                              Basic SQL 27
SIE30600/CSIEB0290 Database Systems
```

Specifying Key and Referential Integrity Constraints

- PRIMARY KEY clause
 - Specifies one or more attributes that make up the primary key of a relation
 - Dnumber INT PRIMARY KEY;
- UNIQUE clause
 - Specifies alternate (secondary) keys
 - Dname VARCHAR (15) UNIQUE;

SIE30600/CSIEB0290 Database System

Primary Key can have more than one attributes

• PRIMARY KEY $(A_1, ..., A_n)$

Example: Declare *branch_name* as the primary key for *branch*.

```
create table branch (
branch_name char(15),
branch_city char(30),
assets integer,
primary key (branch_name) );
```

primary key declaration on an attribute automatically ensures **not null** in SQL-92 onwards, needs to be explicitly stated in SQL-89

SIE30600/CSIEB0290 Database Systems

Basic SQL 2

Specifying Referential Integrity Constraints

- FOREIGN KEY clause
 - Default operation: reject update on violation
 - Attach referential triggered action clause
 - Options include SET NULL, CASCADE, and SET DEFAULT (next slide)
 - Action taken by the DBMS for SET NULL or SET
 DEFAULT is the same for both ON DELETE and ON
 UPDATE
 - CASCADE option suitable for "relationship" relations

CSIE30600/CSIEB0290 Database Systems

Basic SQL 31

Referential Integrity Options

 We can specify CASCADE, SET NULL or SET DEFAULT on referential integrity constraints (foreign keys)

```
CREATE TABLE DEPT (

Dname VARCHAR(10) NOT NULL,

Dnumber INTEGER NOT NULL,

MGRSSN CHAR(9),

MGRStartDate CHAR(9),

PRIMARY KEY (Dnumber),

UNIQUE (Dname),

FOREIGN KEY (MGRSSN) REFERENCES EMP(ESSN)

ON DELETE SET DEFAULT

ON UPDATE CASCADE);
```

Referential Integrity Options (conta

```
CREATE TABLE EMP (
               VARCHAR (30)
                             NOT NULL,
    ENAME
    ESSN
               CHAR (9),
               DATE,
    BDATE
               INTEGER DEFAULT 1,
    SUPERSSN CHAR (9),
    PRIMARY KEY (ESSN),
    FOREIGN KEY (DNO) REFERENCES DEPT
     ON DELETE SET DEFAULT
     ON UPDATE CASCADE,
    FOREIGN KEY (SUPERSSN) REFERENCES
    EMP
     ON DELETE SET NULL
     ON UPDATE CASCADE);
SIE30600/CSIEB0290 Database Systems
                                          Basic SQL 32
```

Giving Names to Constraints

- Keyword **CONSTRAINT**
 - Name a constraint
 - Useful for later altering

SIE30600/CSIEB0290 Database Systems

Basic SQL 33

Specifying Constraints on Tuples Using CHECK

- CHECK clauses at the end of a CREATE TABLE statement
 - Apply to each tuple individually
 - CHECK (Dept_create_date <=
 Mgr start date);</pre>

CSIE30600/CSIEB0290 Database System

CHECK

- CHECK (P), where P is a predicate
 - P must be satisfied by all tuples
- Example: Declare branch-name as the primary key for branch and ensure that the values of assets are nonnegative.

CREATE TABLE branch (

```
branch-name char(15),
branch-city char(30)
assets integer,
PRIMARY KEY (branch-name),
CHECK (assets >= 0));
```

Basic SQL 35

Drop and Alter Table Constructs

- The DROP TABLE command deletes all information about the dropped relation from the database.
- The ALTER TABLE command is used to add attributes to an existing relation:

ALTER TABLE *r* add *A D*

where A (attribute name) and D is the domain of A.

- All tuples in the relation are assigned *null* as the value for the new attribute.
- The ALTER TABLE command can also be used to drop attributes of a relation:

ALTER TABLE r drop A

where A is the name of an attribute of relation r

- Dropping of attributes is not supported by many databases

SIE30600/CSIEB0290 Database System

DROP TABLE

- Used to remove a relation (base table) and its definition
- The relation can no longer be used in queries, updates, or any other commands since its description no longer exists
- Example:

DROP TABLE DEPENDENT;

IE30600/CSIEB0290 Database Systems

Basic SQL 37

ALTER TABLE

- Used to add an attribute to one of the base relations
 - The new attribute will have NULLs in all the tuples of the relation right after the command is executed; hence, the NOT NULL constraint is not allowed for such an attribute
- Example:

ALTER TABLE EMPLOYEE ADD JOB VARCHAR (12);

- The database users must still enter a value for the new attribute JOB for each EMPLOYEE tuple.
 - This can be done using the UPDATE command.

CSIE30600/CSIEB0290 Database System

Retrieval Queries

- SQL has one basic statement for retrieving information from a database: SELECT statement
 - This is *not the same as* the σ of the relational algebra
- Important distinction between SQL and the formal relational model:
 - SQL allows a table (relation) to have two or more tuples that are identical in all their attribute values
 - Hence, an SQL relation (table) is a multi-set (a bag) of tuples; it is not a set of tuples
- SQL relations can be constrained to be sets by specifying PRIMARY KEY or UNIQUE attributes, or by using the DISTINCT option in a query

SIE30600/CSIEB0290 Database Systems

Basic SQL 39

Bag

- A bag or multi-set is like a set, but an element may appear more than once.
 - Example: {A, B, C, A} is a bag. {A, B, C} is a bag that is also a set.
 - Bags also resemble lists, but the order is irrelevant in a bag.
- Example:
 - $\{A, B, A\} = \{B, A, A\}$ as bags
 - However, [A, B, A] is not equal to [B, A, A] as lists

SIE30600/CSIEB0290 Database System

SELECT Statement

 Basic form of the SQL SELECT statement is called a mapping or a SELECT-FROM-WHERE block

SELECT <attribute list>

FROM
WHERE <condition>

- <attribute list> is a list of attribute names whose values are to be retrieved by the query
- is a list of the relation names required to process the query
- <condition> is a conditional (Boolean) expression that identifies the tuples to be retrieved by the query

SIE30600/CSIEB0290 Database Systems

Basic SQL 4

SELECT Statement

Logical comparison operators

$$-=$$
, <, <=, >, >=, and <>

- Projection attributes
 - Attributes whose values are to be retrieved
- Selection condition
 - Boolean condition that must be true for any retrieved tuple

SIE30600/CSIEB0290 Database Systems

Basic Query Structure

· A typical SQL query has the form:

SELECT
$$A_1, A_2, ..., A_n$$
 FROM $r_1, r_2, ..., r_m$ **WHERE** P

 A_i represents an attribute

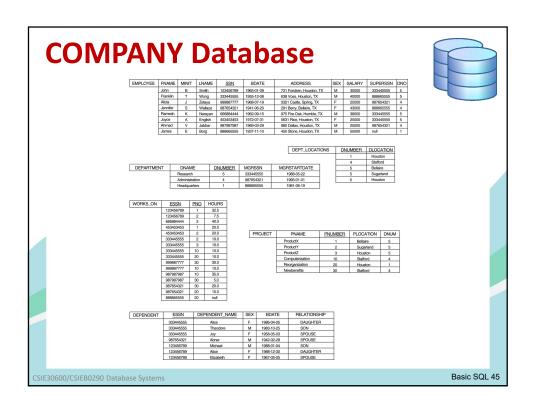

- $-r_i$ represents a relation
- P is a predicate.
- This query is equivalent to the relational algebra expression (more about this in later chapter)

$$\prod_{A_1,A_2,\ldots,A_n} (\sigma_P(r_1 \times r_2 \times \ldots \times r_m))$$

The result of an SQL query is a relation.

E30600/CSIEB0290 Database Systems

Simple SQL Queries

- Basic SQL queries correspond to using the following operations of the relational algebra:
 - SELECT
 - PROJECT
 - JOIN
- All subsequent examples use the COMPANY database

CSIE30600/CSIEB0290 Database Systems

Simple SQL Queries (contd.)

Example of a simple query on one relation

Figure 6.3

Results of SQL queries when applied to the COMPANY database state shown in Figure 5.6. (a) Q0. (b) Q1. (c) Q2. (d) Q8. (e) Q9. (f) Q10. (g) Q1C.

(a)	Bdate	Address	
	1965-01-09	731Fondren, Houston, TX	

Fname	Lname	Address		
John Smith Franklin Wong Ramesh Narayan Joyce English		731 Fondren, Houston, TX 638 Voss, Houston, TX 975 Fire Oak, Humble, TX		
				5631 Rice, Houston, TX

Query 0. Retrieve the birth date and address of the employee(s) whose name is 'John B. Smith'.

(b)

Q0: SELECT Bdate, Address FROM EMPLOYEE

WHERE Fname='John' AND Minit='B' AND Lname='Smith';

Query 1. Retrieve the name and address of all employees who work for the 'Research' department.

Q1: SELECT Fname, Lname, Address FROM EMPLOYEE, DEPARTMENT

WHERE Dname='Research' AND Dnumber=Dno;

IE30600/CSIEB0290 Database Systems

Basic SQL 47

Simple SQL Queries (contd.)

Figure 6.3

Results of SQL queries when applied to the COMPANY database state shown in Figure 5.6. (a) Q0. (b) Q1. (c) Q2. (d) Q8. (e) Q9. (f) Q10. (g) Q1C.

(c)	Pnumber	Dnum	Lname	Address	Bdate
	10	4	Wallace	291Berry, Bellaire, TX	1941-06-20
	30	4	Wallace	291Berry, Bellaire, TX	1941-06-20

Query 2. For every project located in 'Stafford', list the project number, the controlling department number, and the department manager's last name, address, and birth date.

Q2: SELECT Pnumber, Dnum, Lname, Address, Bdate PROJECT, DEPARTMENT, EMPLOYEE

WHERE Dnum=Dnumber AND Mgr_ssn=Ssn AND

Plocation='Stafford';

CSIE30600/CSIEB0290 Database Systems

Simple SQL Queries (contd.)

- In Q2, there are two join conditions
- The join condition Dnum=Dnumber relates a project to its controlling department
- The join condition Mgrssn=Ssn relates the controlling department to the employee who manages that department

Basic SQL 49

Ambiguous Attribute Names

- In SQL, we can use the same name for two (or more) attributes as long as the attributes are in different relations
- A query that refers to two or more attributes with the same name must qualify the attribute name with the relation name by prefixing the relation name to the attribute name
- Example:

FROM WHERE

Q1A: SELECT Fname, EMPLOYEE.Name, Address EMPLOYEE, DEPARTMENT

DEPARTMENT.Name='Research' AND

DEPARTMENT.Dnumber=EMPLOYEE.Dnumber;

SIE30600/CSIEB0290 Database Systems

Aliases and Tuple Variables

- Some queries need to refer to the same relation more than once.
 - In this case, aliases are given to the relation name
- Query 8: For each employee, retrieve the employee's name, and the name of his or her immediate supervisor.

```
Q8: SELECT E.Fname, E.Lname, S.Fname, S.Lname
FROM EMPLOYEE ES
WHERE E.Superssn=S.ssn
```

- In Q8, the alternate relation names E and S are called *aliases* or *tuple variables* for the EMPLOYEE relation
- We can think of E and S as two different copies of EMPLOYEE; E represents employees in role of supervisees and S represents employees in role of supervisors

SIE30600/CSIEB0290 Database Systems

Basic SQL 51

Aliases and Tuple Variables (cont

- Aliasing can also be used in any SQL query for convenience
- Can also use the AS keyword to specify aliases (rename operation)

```
Q8: SELECT E.Fname, E.Lname, S.Fname, S.Lname FROM EMPLOYEE AS E, EMPLOYEE AS S
WHERE E.Superssn=S.Ssn
```

SIE30600/CSIEB0290 Database System

Unspecified WHERE-clause

- A missing WHERE-clause indicates no condition; hence, all tuples of the relations in the FROM-clause are selected
 - This is equivalent to the condition WHERE TRUE
- Query 9: Retrieve the SSN values for all employees.

– Q9: SELECT Ssn FROM EMPLOYEE

 If more than one relation is specified in the FROMclause and there is no join condition, then the CARTESIAN PRODUCT of tuples is selected

SIE30600/CSIEB0290 Database Systems

Basic SQL 53

Unspecified WHERE-clause (contd.)

• Example:

Q10: SELECT Ssn, Dname

FROM EMPLOYEE, DEPARTMENT

 It is extremely important not to overlook specifying any selection and join conditions in the WHERE-clause; otherwise, incorrect and very large relations may result

SIE30600/CSIEB0290 Database System

Use of *

 To retrieve all the attribute values of the selected tuples, a * is used, which stands for all the attributes

• Examples:

Q1C: SELECT *

FROM EMPLOYEE Dno=5;

Q1D: SELECT *

FROM EMPLOYEE, DEPARTMENT

WHERE Dname='Research' AND Dno=Dnumber;

Q10A: SELECT

FROM EMPLOYEE, DEPARTMENT;

E30600/CSIEB0290 Database Systems

Basic SQL 55

Use of DISTINCT

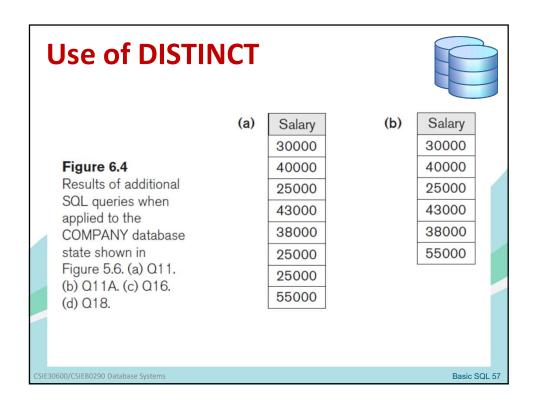

- SQL does not treat a relation as a set; duplicate tuples can appear
- To eliminate duplicate tuples in a query result, the keyword **DISTINCT** is used
- For example, the result of Q11 may have duplicate SALARY values whereas Q11A does not have any duplicate values

Query 11. Retrieve the salary of every employee (Q11) and all distinct salary values (Q11A).

Q11: SELECT ALL Salary FROM EMPLOYEE;

Q11A: SELECT DISTINCT Salary
FROM EMPLOYEE;

SIE30600/CSIEB0290 Database Systems

Challenge Question

 Under what conditions are the following two queries equivalent?

SELECT DISTINCT A

FROM Table1;

SELECT A

FROM Table1;

Note: Two queries are equivalent only if they produce identical results for all instances

CSIE30600/CSIEB0290 Database System

DISTINCT: A Word of Caution

- In theory, placing a DISTINCT after select is harmless
- In practice, it is very expensive
 - The time it takes to sort a relation so that duplicates are eliminated can be greater than the time to execute the query itself!
- Use DISTINCT only when you really need it

SIE30600/CSIEB0290 Database Systems

Basic SQL 59

Set Operations

- SQL has directly incorporated some set operations
- There is a union operation (UNION), and in some versions of SQL there are set difference (MINUS, EXCEPT) and intersection (INTERSECT) operations
- The resulting relations of these set operations are sets of tuples; duplicate tuples are eliminated from the result
- The set operations apply only to union compatible relations; the two relations must have the same attributes and the attributes must appear in the same order

SIE30600/CSIEB0290 Database Systems

Set Operations (cont.)

 Query 4: Make a list of all project numbers for projects that involve an employee whose last name is 'Smith' as a worker or as a manager of the department that controls the project.

Q4A: (SELECT DISTINCT Pnumber
FROM PROJECT, DEPARTMENT, EMPLOYEE
WHERE Dnum=Dnumber AND Mgr_ssn=Ssn
AND Lname='Smith')

UNION
(SELECT DISTINCT Pnumber
FROM PROJECT, WORKS_ON, EMPLOYEE
WHERE Pnumber=Pno AND Essn=Ssn
AND Lname='Smith');

SIE30600/CSIEB0290 Database Systems

Basic SQL 61

Substring Pattern Matching and Arithmetic Operators

- LIKE comparison operator
 - Used for string pattern matching
 - Percent(%) matches an arbitrary number of zero or more characters
 - Underscore(_) matches a single character
- Standard arithmetic operators:
 - Addition (+), subtraction (-), multiplication (*), and division (/)
- BETWEEN comparison operator (for range)

CSIE30600/CSIEB0290 Database System

Substring Comparison(cont.)

 Query: Retrieve all employees whose address is in Houston, Texas. Here, the value of the ADDRESS attribute must contain the substring 'Houston,TX' in it.

Q: **SELECT** FNAME, LNAME

FROM EMPLOYEE

WHERE ADDRESS LIKE '%Houston,TX%'

IE30600/CSIEB0290 Database Systems

Basic SQL 63

Substring Comparison (cont.)

- Query: Retrieve all employees who were born during the 1950s.
 - Here, '195' must be the prefix of the string (according to the format for date), so the BDATE value is '195_____', with each underscore as a place holder for a single arbitrary character.

Q: **SELECT** FNAME, LNAME

FROM EMPLOYEE

WHERE BDATE LIKE '195 '

- The LIKE operator allows us to get around the fact that each value is considered atomic and indivisible
 - Hence, in SQL, character string attribute values are not atomic

CSIE30600/CSIEB0290 Database System

String Operations

Match the name "Main%"

LIKE 'Main\%' escape '\'

- SQL supports a variety of string operations such as
 - concatenation (using "||")
 - ... WHERE name = 'Juliana' || 'Freire'
 - converting from upper to lower case (and vice versa)
 - UPPER(name); LOWER(name)
 - finding string length, extracting substrings, etc.

SIE30600/CSIEB0290 Database Systems

Basic SQL 65

Arithmetic Operations

- The standard arithmetic operators '+', '-'. '*', and '/' (for addition, subtraction, multiplication, and division, respectively) can be applied to numeric values in an SQL query result
- Query: Show the effect of giving all employees who work on the 'ProductX' project a 10% raise.

Q: SELECT FNAME, LNAME, 1.1*SALARY
FROMEMPLOYEE, WORKS_ON, PROJECT
WHERE SSN=ESSN AND PNO=PNUMBER
AND PNAME='ProductX'

CSIE30600/CSIEB0290 Database Systems

Ordering of Query Results

- Use ORDER BY clause
 - Keyword DESC to see result in a descending order of values
 - Keyword ASC to specify ascending order explicitly
 - -ORDER BY D.Dname DESC, E.Lname ASC, E.Fname ASC

SIE30600/CSIEB0290 Database Systems

Basic SQL 67

ORDER BY

 Query: Retrieve a list of employees and the projects each works in, ordered by the employee's department, and within each department ordered alphabetically by employee last name.

Q: **SELECT** DNAME, LNAME, FNAME, PNAME

FROM DEPARTMENT, EMPLOYEE,

WORKS_ON, PROJECT

WHERE DNUMBER=DNO AND SSN=ESSN

AND PNO=PNUMBER

ORDER BY DNAME, LNAME

CSIE30600/CSIEB0290 Database Systems

ORDER BY (cont.)

- The default order is in ascending order of values
- We can specify the keyword DESC if we want a descending order; the keyword ASC can be used to explicitly specify ascending order, even though it is the default

IE30600/CSIEB0290 Database Systems

Basic SQL 69

Discussion and Summary of Basic SQL Retrieval Queries

```
SELECT <attribute list>
FROM 
[ WHERE <condition> ]
[ ORDER BY <attribute list> ];
```

CSIE30600/CSIEB0290 Database System

INSERT, DELETE, and UPDATE Statements in SQL

- Three commands used to modify the database:
 - INSERT, DELETE, and UPDATE

SIE30600/CSIEB0290 Database Systems

Basic SQL 71

The INSERT Command

 Specify the relation name and a list of values for the tuple

U1: INSERT INTO

EMPLOYEE

VALUES

('Richard', 'K', 'Marini', '653298653', '1962-12-30', '98

Oak Forest, Katy, TX', 'M', 37000, '653298653', 4);

U3B: 1

INSERT INTO

WORKS_ON_INFO (Emp_name, Proj_name,

Hours_per_week)

SELECT

E.Lname, P.Pname, W.Hours

FROM WHERE PROJECT P, WORKS_ON W, EMPLOYEE E

P.Pnumber=W.Pno AND W.Essn=E.Ssn;

CSIE30600/CSIEB0290 Database Systems

INSERT (cont.)

- An alternate form of INSERT specifies explicitly the attribute names that correspond to the values in the new tuple
 - Attributes with NULL values can be left out
- Example: Insert a tuple for a new EMPLOYEE for whom we only know the FNAME, LNAME, and SSN attributes.

INSERT INTO EMPLOYEE(FNAME, LNAME, SSN) **VALUES** ('Richard', 'Marini', '653298653')

SIE30600/CSIEB0290 Database Systems

Basic SQL 7

INSERT (cont.)

 Important Note: Only the constraints specified in the DDL commands are automatically enforced by the DBMS when updates are applied to the database

SIE30600/CSIEB0290 Database System

The DELETE Command

- Removes tuples from a relation
 - Includes a WHERE clause to select the tuples to be deleted

U4A: DELETE FROM EMPLOYEE

WHERE Lname='Brown';

U4B: DELETE FROM EMPLOYEE

WHERE Ssn='123456789';

U4C: DELETE FROM EMPLOYEE WHERE Dno=5;

U4D: DELETE FROM EMPLOYEE;

SIE30600/CSIEB0290 Database Systems

Basic SQL 75

DELETE (cont.)

- Removes tuples from a relation
 - Includes a WHERE-clause to select the tuples to be deleted
 - Referential integrity should be enforced
 - Tuples are deleted from only one table at a time (unless CASCADE is specified on a referential integrity constraint)
 - A missing WHERE-clause specifies that all tuples in the relation are to be deleted; the table then becomes an empty table
 - The number of tuples deleted depends on the number of tuples in the relation that satisfy the WHERE-clause

SIE30600/CSIEB0290 Database Systems

The UPDATE Command

- Additional SET clause in the UPDATE command
 - Specifies attributes to be modified and new values

U5: UPDATE PROJECT
SET Plocation =

SET Plocation = 'Bellaire', Dnum = 5
WHERE Pnumber=10;

IE30600/CSIEB0290 Database Systems

Basic SQL 7

Additional Features of SQL

- Techniques for specifying complex retrieval queries
- Writing programs in various programming languages that include SQL statements
- Set of commands for specifying physical database design parameters, file structures for relations, and access paths
- Transaction control commands

SIE30600/CSIEB0290 Database Systems

Additional Features of SQL (cont.)

- Specifying the granting and revoking of privileges to users
- Constructs for creating triggers
- Enhanced relational systems known as objectrelational
- New technologies such as XML and OLAP
- Temporal database features
- Working with JSON data

SIE30600/CSIEB0290 Database Systems

Basic SQL 79

Summary

- SQL
 - Comprehensive language
 - Data definition, queries, updates, constraint specification, and view definition
- Covered in Chapter 6:
 - Data definition commands for creating tables
 - Commands for constraint specification
 - Simple retrieval queries
 - Database update commands

SIE30600/CSIEB0290 Database Systems

Assignment 3

- Textbook(DBSC7) exercises: 3.14, 3.15, 3.16, 3.17, 3.18
- Due date: Nov 24, 2022
