Database Systems

**Lecture 8: Enhanced  
Entity-Relationship(EER)  
Model**

## Outline

- ⦿ EER stands for **Enhanced**(or **Extended**) ER
- ⦿ EER Model Concepts
  - ⦿ Includes all modeling concepts of basic ER
  - ⦿ **Additional concepts:**
    - subclasses/superclasses
    - specialization/generalization
    - categories (UNION types)
    - attribute and relationship inheritance
  - ⦿ These are fundamental to conceptual modeling
- ⦿ The additional EER concepts are used to model applications more completely and more accurately
  - ⦿ EER includes some object-oriented concepts, such as inheritance

EER Model 2

## Enhanced Entity-Relationship (EER) Model

- ⊙ **Enhanced ER (EER) model**
  - ⊙ Created to design more **accurate database schemas**
    - Reflect the data properties and constraints more precisely
  - ⊙ For modeling more complex requirements than traditional applications

EER Model 3

## Subclass, Superclass, and Inheritance

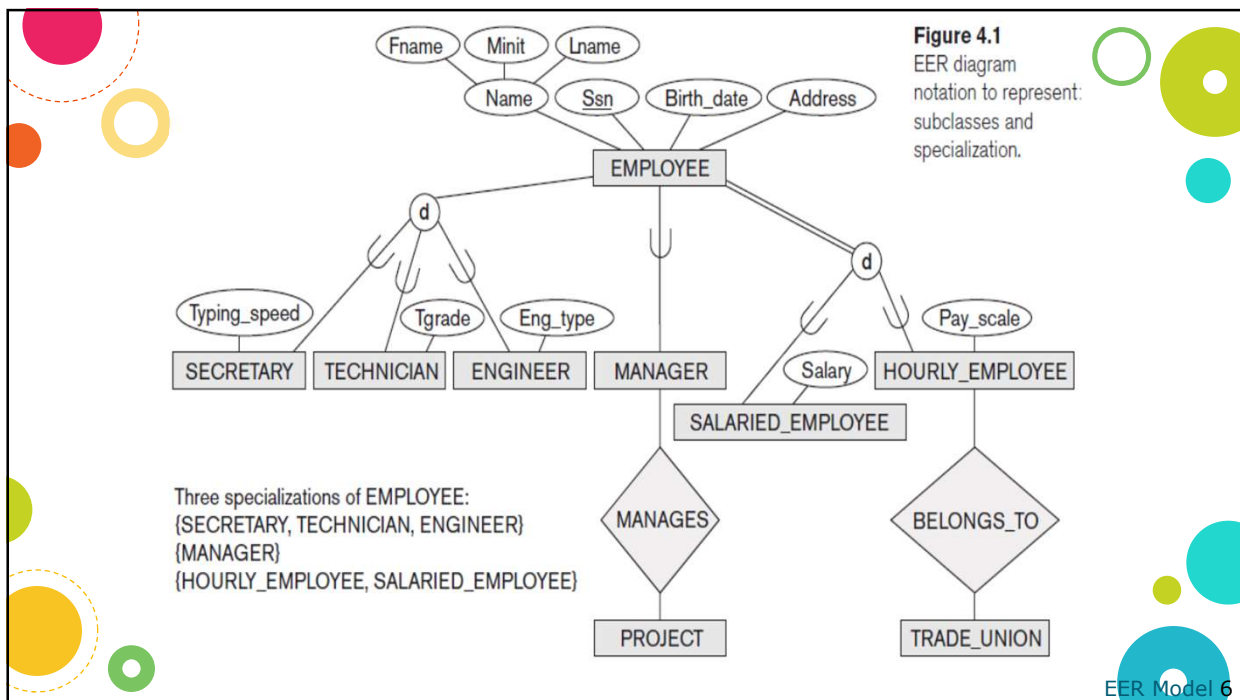

- ⊙ EER model includes all modeling concepts of the ER model
- ⊙ In **addition**, EER includes:
  - ⊙ Subclasses and superclasses
  - ⊙ Specialization and generalization
  - ⊙ Category or union type
  - ⊙ Attribute and relationship inheritance
- ⊙ EER includes some **object-oriented** concepts

EER Model 4

# Subclass and Superclass (1)

- ⦿ An entity type may have additional meaningful **subgroupings** of its entities
  - ⦿ Example: EMPLOYEE may be further grouped into:
    - SECRETARY, ENGINEER, TECHNICIAN, ...
      - Based on the EMPLOYEE's Job
    - MANAGER
      - EMPLOYEEs who are managers
    - SALARIED\_EMPLOYEE, HOURLY\_EMPLOYEE
      - Based on the EMPLOYEE's method of pay
- ⦿ EER diagrams extend ER diagrams to represent these additional subgroupings, called **subclasses** or **subtypes**

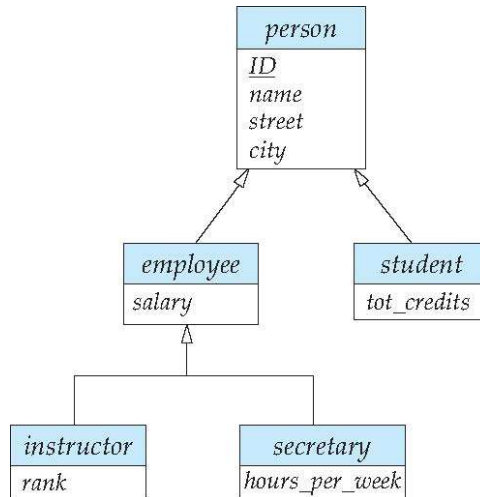

EER Model 5

EER Model 6

## Alternative Notations

- Just like basic ER model, many alternative notations exist.

EER Model 7

## Subclass and Superclass (2)

- Each of these subgroupings is a subset of EMPLOYEE entities
- Each is called a **subclass** of EMPLOYEE
- EMPLOYEE is the **superclass** for each of these subclasses
- These are called **superclass/subclass relationships**:
  - EMPLOYEE/SECRETARY
  - EMPLOYEE/TECHNICIAN
  - EMPLOYEE/MANAGER
  - ...

EER Model 8

## Subclass and Superclass (3)

- ⦿ These are also called **IS-A** relationships
  - ⦿ SECRETARY IS-A EMPLOYEE, TECHNICIAN IS-A EMPLOYEE, ....
- ⦿ Note: An entity that is member of a subclass represents **the same** real-world entity as some member of the superclass:
  - ⦿ The subclass member is the same entity in a *distinct specific role*
  - ⦿ An entity **cannot** exist in the database merely by being a member of a subclass; it must also be a member of the superclass
  - ⦿ A member of the superclass can be **optionally** included as a member of any number of its subclasses

EER Model 9

## Subclass and Superclass (4)

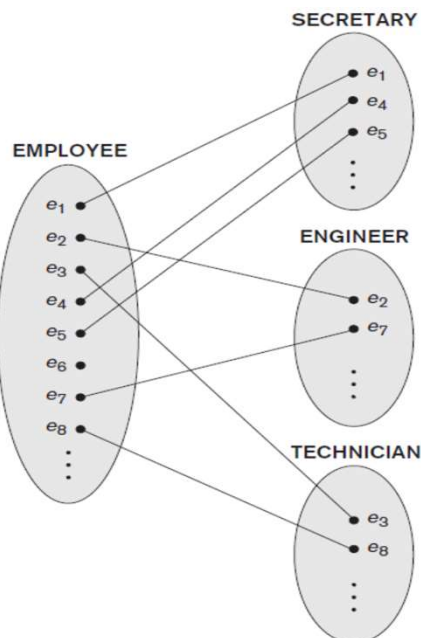

- ⦿ Examples:
  - ⦿ A salaried employee who is also an engineer belongs to the two subclasses:
    - ENGINEER, and
    - SALARIED\_EMPLOYEE
  - ⦿ A salaried employee who is also an engineering manager belongs to the three subclasses:
    - MANAGER,
    - ENGINEER, and
    - SALARIED\_EMPLOYEE
- ⦿ It is **not necessary** that every entity in a superclass be a member of some subclass

EER Model 10

# Specialization (1)

- ◎ **Specialization** is the process of defining a set of subclasses of a superclass
- ◎ The set of subclasses is based upon some **distinguishing characteristics** of the entities in the superclass
  - ◎ Example: {SECRETARY, ENGINEER, TECHNICIAN} is a specialization of EMPLOYEE based upon **job type**.
    - May have several specializations of the same superclass

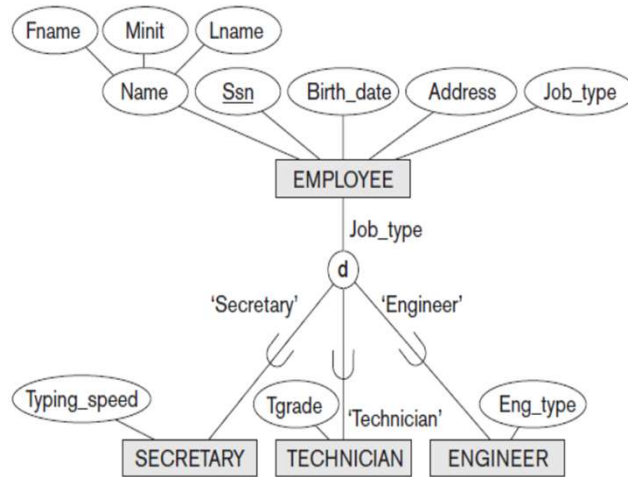

EER Model 11

**Figure 4.2**  
Instances of a specialization.

EER Model 12

## Specialization in EER Diagrams

**Figure 4.4**  
EER diagram notation  
for an attribute-defined  
specialization on  
Job\_type.

EER Model 13

## Specialization (2)

- ⊙ Example: Another specialization of EMPLOYEE based on *method of pay* is {SALARIED\_EMPLOYEE, HOURLY\_EMPLOYEE}.
  - ⊙ Superclass/subclass relationships and specialization can be diagrammatically represented in EER diagrams
  - ⊙ Attributes of a subclass are called **specific** or **local attributes**.
    - For example, the attribute TypingSpeed of SECRETARY
  - ⊙ The subclass can also participate in **specific relationship types**.
    - For example, a relationship BELONGS\_TO of HOURLY\_EMPLOYEE

EER Model 14

## Attribute Inheritance

- ⦿ A subclass entity **inherits**
  - ⦿ All **attributes** of the superclass
  - ⦿ All **relationships** of the superclass
  - ⦿ (the IS-A relationship)
- ⦿ Example:
  - ⦿ In the previous slide, SECRETARY (as well as TECHNICIAN and ENGINEER) inherit the attributes Name, SSN, ..., from EMPLOYEE
  - ⦿ Every SECRETARY entity will have values for the inherited attributes

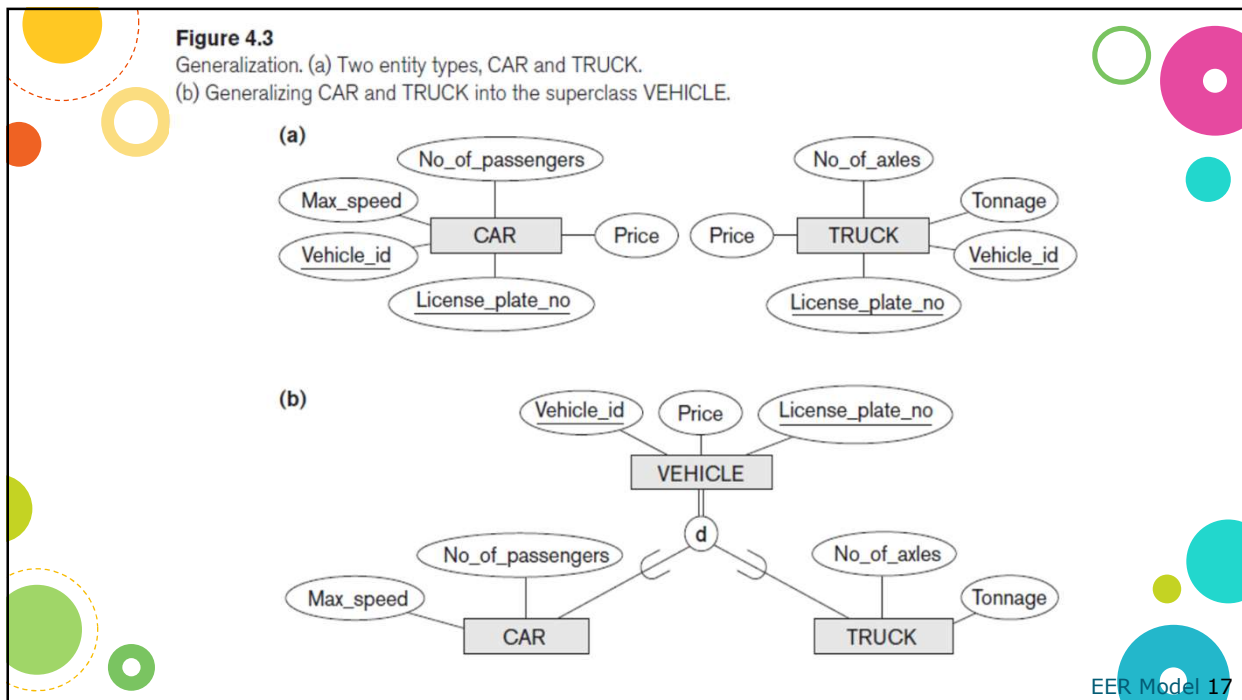

EER Model 15

## Generalization

- ⦿ **Generalization**
  - ⦿ Process of defining a generalized entity type from the given entity types
  - ⦿ The **reverse** of specialization
- ⦿ Several classes with **common features** are generalized into a superclass;
  - ⦿ original classes become its subclasses
- ⦿ Example: CAR, TRUCK generalized into VEHICLE;
  - ⦿ both CAR, TRUCK become subclasses of VEHICLE.
  - ⦿ We can view {CAR, TRUCK} as a specialization of VEHICLE
  - ⦿ Alternatively, we can view VEHICLE as a generalization of CAR and TRUCK

EER Model 16

## Generalization and Specialization (1)

- ⊙ Diagrammatic notation are sometimes used to distinguish between generalization and specialization
  - ⊙ Arrow pointing to the generalized superclass represents a generalization
  - ⊙ Arrows pointing to the specialized subclasses represent a specialization
  - ⊙ We *do not use* this notation because it is often subjective as to which process is more appropriate for a particular situation
  - ⊙ We advocate not drawing any arrows

EER Model 18

## Generalization and Specialization (2)

- ⊙ Data Modeling with Specialization and Generalization
  - ⊙ A superclass or subclass represents a collection (or set or grouping) of entities
  - ⊙ It also represents a particular *type of entity*
  - ⊙ Shown in **rectangles** in EER diagrams (as are entity types)
  - ⊙ We can call all entity types (and their corresponding collections) **classes**, whether they are entity types, superclasses, or subclasses

EER Model 19

## Constraints on Specialization and Generalization

- ⊙ If we can determine exactly those entities that will become members of each subclass by a condition, the subclasses are called **predicate-defined** (or **condition-defined**) subclasses
  - ⊙ **Condition** is a constraint that determines **subclass members**
  - ⊙ Display a predicate-defined subclass by writing the **predicate condition** next to the line attaching the subclass to its superclass

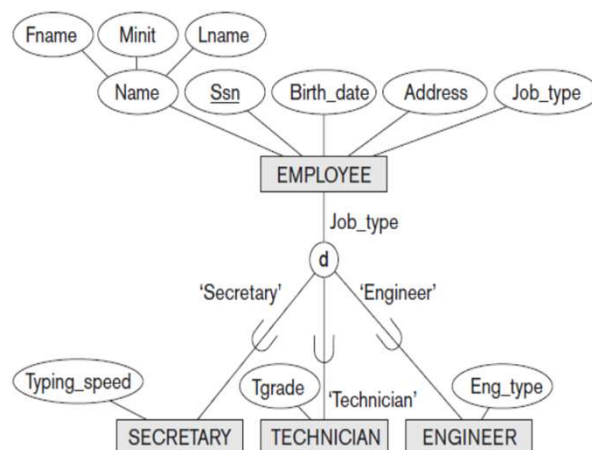

EER Model 20

## Attribute-Defined Constraints

- ⦿ If all subclasses have membership condition on **same attribute** of the superclass, the specialization is called an **attribute-defined** specialization
  - ⦿ Attribute is called the **defining attribute** of the specialization
  - ⦿ Example: JobType is the defining attribute of the specialization {SECRETARY, TECHNICIAN, ENGINEER} of EMPLOYEE

EER Model 21

## Attribute-defined Specialization

**Figure 4.4**  
EER diagram notation  
for an attribute-defined  
specialization on  
Job\_type.

EER Model 22

## User-Defined Constraints

- ⦿ If no condition determines membership, the subclass is called **user-defined**
  - ⦿ Membership in a subclass is determined by the database users by applying an operation to add an entity to the subclass
  - ⦿ Membership in the subclass is specified individually for each entity in the superclass by the user

EER Model 23

## Constraints on Specialization and Generalization

- ⦿ Two basic constraints can apply to a specialization/generalization:
  - ⦿ **Disjointness** Constraint:
  - ⦿ **Completeness** Constraint:

EER Model 24

## Disjointness Constraint

- ⦿ Specifies that the subclasses of the specialization must be **disjoint**:
  - ⦿ an entity can be a member of **at most one** of the subclasses of the specialization
- ⦿ Specified by **d** in EER diagram
- ⦿ If not disjoint, specialization is **overlapping**:
  - ⦿ that is the same entity may be a member of **more than one** subclass of the specialization
- ⦿ Specified by **o** in EER diagram

EER Model 25

## Completeness Constraint

- ⦿ **Total** specifies that **every** entity in the superclass must be a member of **some** subclass in the specialization/generalization
- ⦿ Shown in EER diagrams by a **double line**
- ⦿ **Partial** allows an entity not to belong to any of the subclasses
- ⦿ Shown in EER diagrams by a **single line**

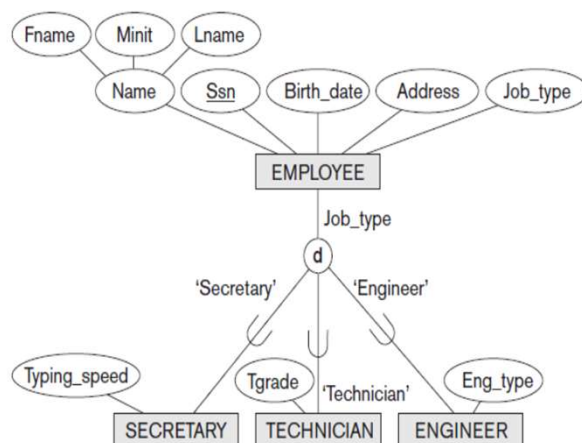

EER Model 26

## Constraints Combination

- ⦿ Hence, we have four types of specialization/generalization:
  - ⦿ Disjoint, total
  - ⦿ Disjoint, partial
  - ⦿ Overlapping, total
  - ⦿ Overlapping, partial
- ⦿ Note: Generalization usually is total because the superclass is derived from the subclasses.

EER Model 27

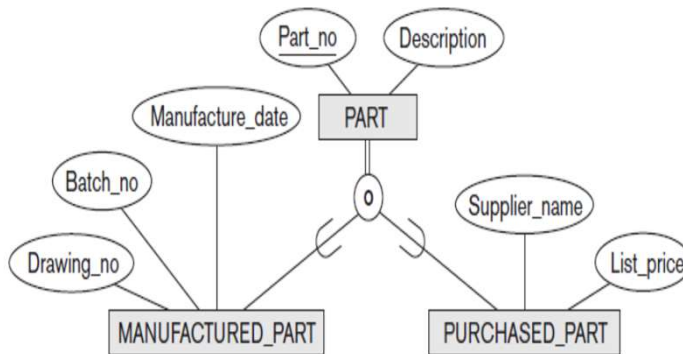

## Example of Disjoint Partial Specialization

**Figure 4.4**  
EER diagram notation  
for an attribute-defined  
specialization on  
**Job\_type**.

EER Model 28

## Example of Overlapping Total Specialization

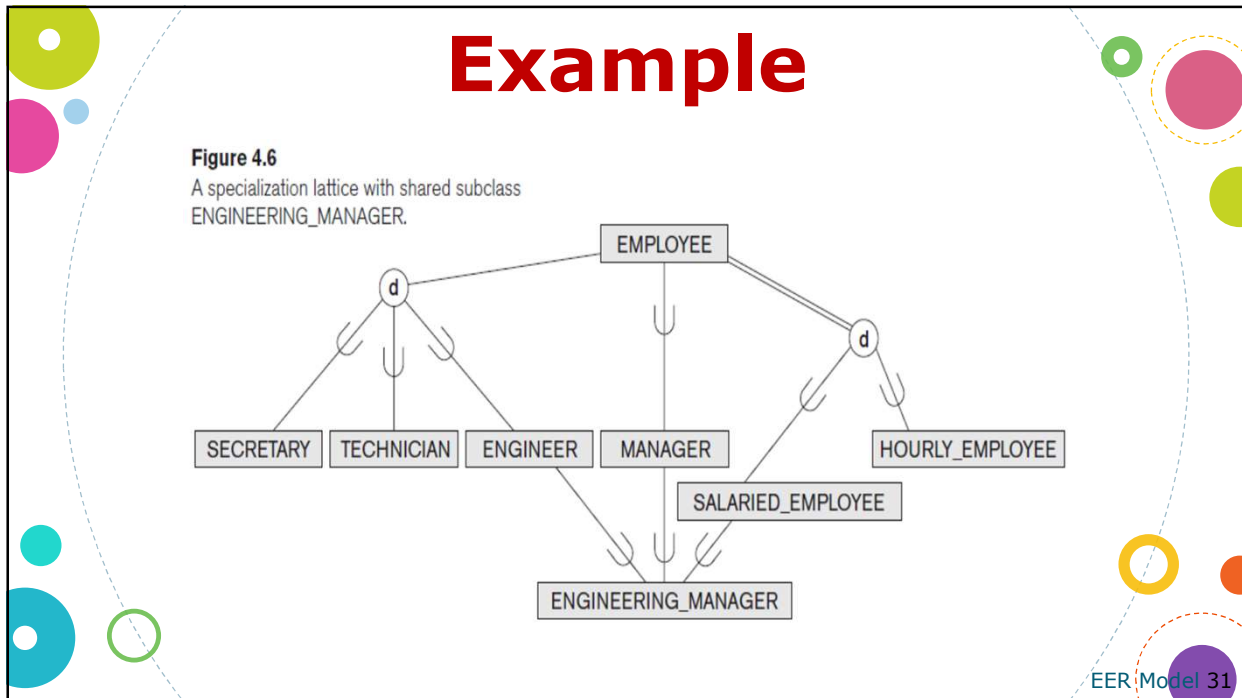

**Figure 4.5**  
EER diagram notation  
for an overlapping  
(nondisjoint)  
specialization.

EER Model 29

## Hierarchies, Lattices & Shared Subclasses (1)

- ⊙ A subclass may itself have further subclasses specified on it
  - ⊙ forms a **hierarchy** or a **lattice**
- ⊙ **Hierarchy** has a constraint that every subclass has only one superclass (called **single inheritance**); this is basically a **tree structure**
- ⊙ In a **lattice**, a subclass can be subclass of more than one superclass (called **multiple inheritance**)

EER Model 30

## Hierarchies, Lattices & Shared Subclasses (2)

- ⊙ In a lattice or hierarchy, a subclass inherits attributes not only of its direct superclass, but also of **all** its predecessor superclasses
- ⊙ A subclass with more than one superclass is called a **shared subclass (multiple inheritance)**
- ⊙ Can have:
  - ⊙ *specialization* hierarchies or lattices, or
  - ⊙ *generalization* hierarchies or lattices,
  - ⊙ depending on how they were *derived*
- ⊙ We just use *specialization* (to stand for the end result of either specialization or generalization)

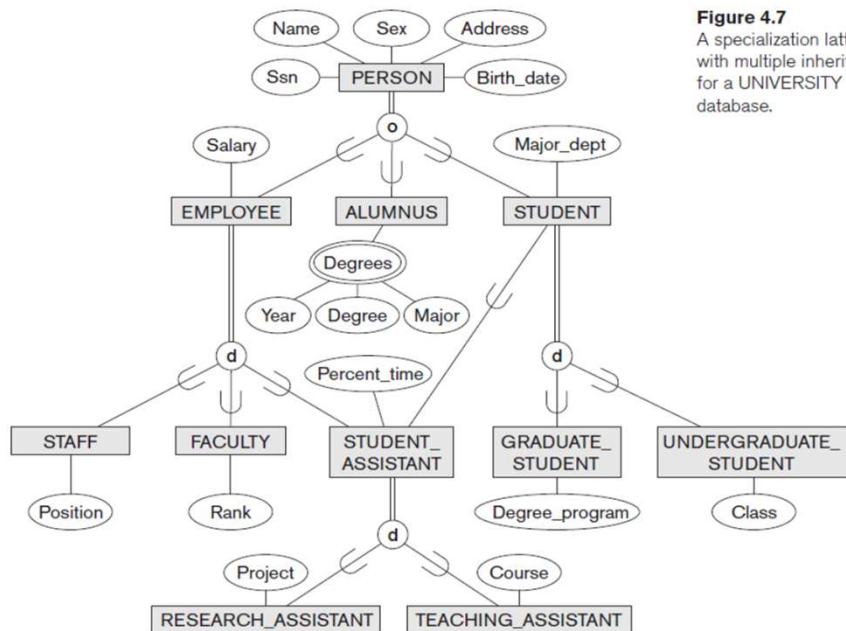

EER Model 32

# Hierarchies, Lattices & Shared Subclasses (3)

- ⦿ In **specialization**, start with an entity type and then define subclasses of the entity type by successive specialization
  - ⦿ Called a **top down** conceptual refinement process
- ⦿ In **generalization**, start with many entity types and generalize those that have common properties
  - ⦿ Called a **bottom up** conceptual synthesis process
- ⦿ In practice, a **combination** of both processes is usually employed

EER Model 33

**Figure 4.7**  
A specialization lattice with multiple inheritance for a UNIVERSITY database.

EER Model 34

## Categories (UNION TYPES) (1)

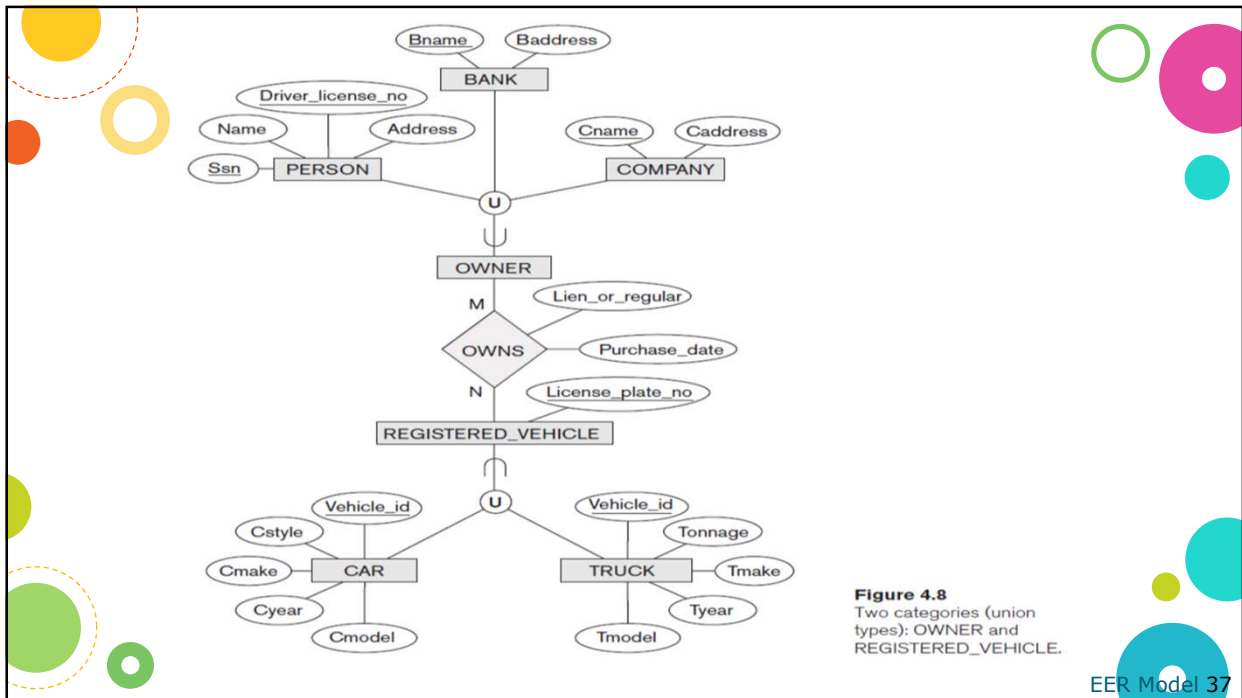

- ⊙ All of the *superclass/subclass relationships* we have seen thus far have a single superclass
- ⊙ A **shared subclass** is a subclass in:
  - ⊙ *more than one* distinct superclass/subclass relationships
  - ⊙ each relationships has a single superclass
  - ⊙ shared subclass leads to multiple inheritance
- ⊙ In some cases, we need to model a **single superclass/subclass relationship** with *more than one superclass*
- ⊙ Superclasses can represent different entity types
- ⊙ Such a subclass is called a **category** or **UNION TYPE**

EER Model 35

## Categories (UNION TYPES) (2)

- ⊙ **Example:** In a database for vehicle registration, a **vehicle owner** can be a PERSON, a BANK (holding a lien(留置權) on a vehicle) or a COMPANY.
  - ⊙ A *category* (UNION type) called OWNER is created to represent a subset of the **UNION** of the three superclasses COMPANY, BANK, and PERSON
  - ⊙ A category member must exist in **at least one** of its superclasses
- ⊙ Difference from **shared subclass**, which is a:
  - ⊙ subset of the **intersection** of its superclasses
  - ⊙ shared subclass member must exist in **all** of its superclasses

EER Model 36

EER Model 37

## Formal Definitions of EER (1)

- ⊙ **Class C:** A type of entity with a corresponding set of entities:
  - ⊙ could be entity type, subclass, superclass, or category
- ⊙ **Note:** The definition of *relationship type* in ER/EER should have 'entity type' replaced with 'class' to allow relationships among classes in general

EER Model 38

## Formal Definitions of EER (2)

- ⊙ **Subclass** S is a class whose:
  - ⊙ Type **inherits** all the **attributes** and **relationship** of class C
  - ⊙ Set of **entities** must always be a subset of the set of entities of the other class C
    - $S \subset C$
  - ⊙ C is called the **superclass** of S
  - ⊙ A **superclass/subclass relationship** exists between S and C

EER Model 39

## Formal Definitions of EER (2)

- ⊙ **Specialization** Z:  $Z = \{S_1, S_2, \dots, S_n\}$  is a set of subclasses with same superclass G; G/S<sub>i</sub> is a superclass relationship for  $i = 1, \dots, n$ .
  - ⊙ G is called a **generalization** of the subclasses  $\{S_1, S_2, \dots, S_n\}$
  - ⊙ Z is **total** if we always have:
    - $S_1 \cup S_2 \cup \dots \cup S_n = G$ ;
    - Otherwise, Z is **partial**.
  - ⊙ Z is **disjoint** if we always have:
    - $S_i \cap S_j = \text{empty-set}$  for  $i \neq j$ ;
    - Otherwise, Z is **overlapping**.

EER Model 40

## Formal Definitions of EER (3)

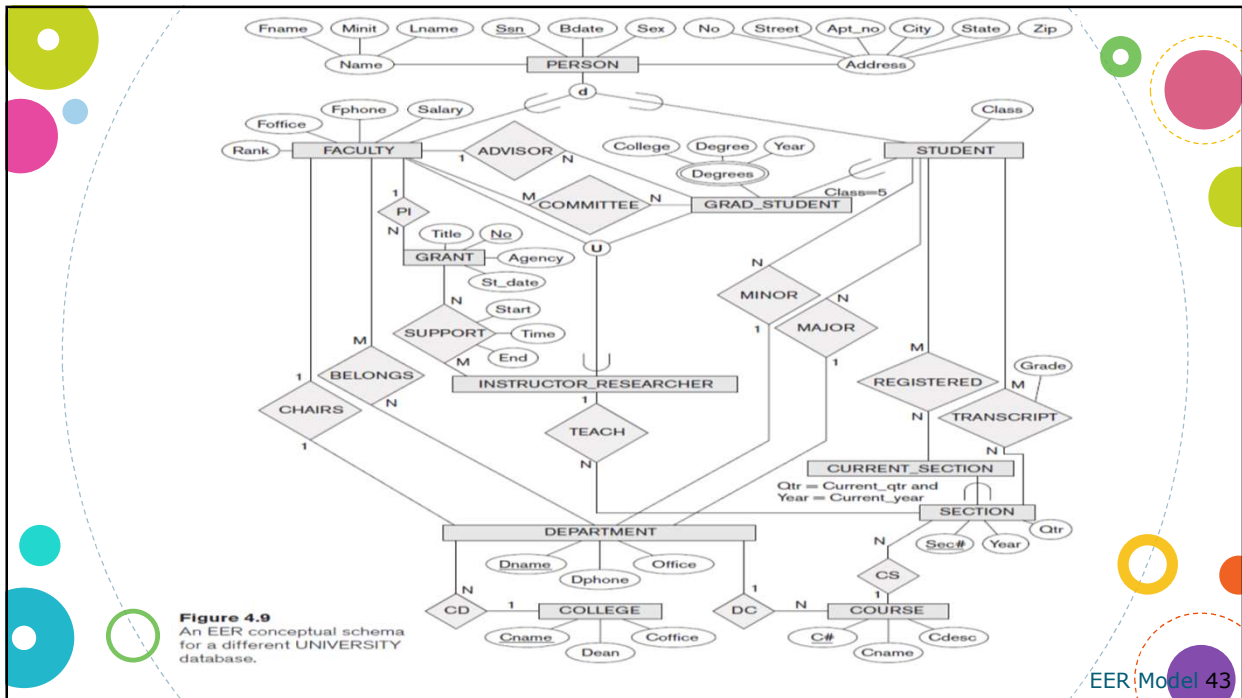

- ⊙ Subclass  $S$  of  $C$  is **predicate defined** if predicate (condition)  $p$  on attributes of  $C$  is used to specify membership in  $S$ ;
  - ⊙ that is,  $S = C[p]$ , where  $C[p]$  is the set of entities in  $C$  that satisfy condition  $p$
- ⊙ A subclass not defined by a predicate is called **user-defined**
- ⊙ **Attribute-defined** specialization: if a predicate  $A = c_i$  (where  $A$  is an **attribute** of  $G$  and  $c_i$  is a constant value from the domain of  $A$ ) is used to specify membership in each subclass  $S_i$  in  $Z$ 
  - ⊙ Note: If  $c_i \neq c_j$  for  $i \neq j$ , and  $A$  is single-valued, then the attribute-defined specialization will be disjoint.

EER Model 41

## Formal Definitions of EER (4)

- ⊙ **Category** or **UNION type**  $T$ 
  - ⊙ A class that is a **subset** of the **union** of  $n$  defining superclasses  $D_1, D_2, \dots, D_n, n > 1$ :
    - $T \subset (D_1 \cup D_2 \cup \dots \cup D_n)$
  - ⊙ Can have a predicate  $p_i$  on the attributes of  $D_i$  to specify entities of  $D_i$  that are members of  $T$ .
  - ⊙ If a predicate is specified on every  $D_i$ :  $T = (D_1[p_1] \cup D_2[p_2] \cup \dots \cup D_n[p_n])$

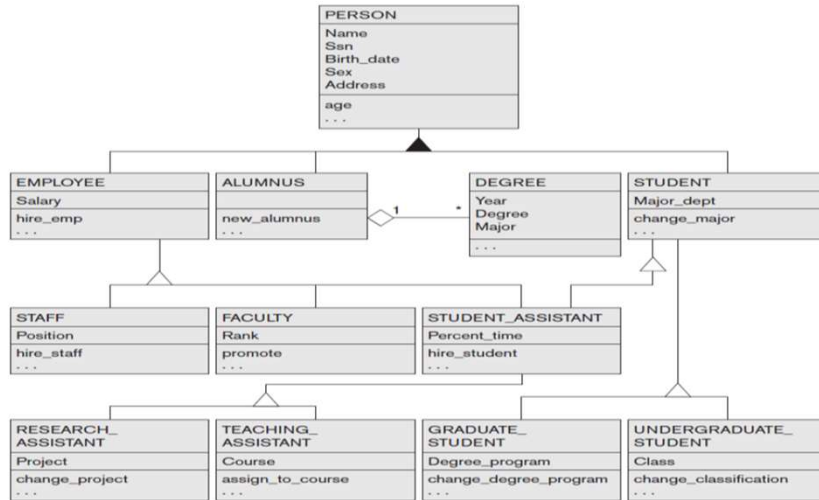

EER Model 42

## Alternative Notations

- ER/EER diagrams are a specific notation for displaying the concepts of the model diagrammatically
- DB design tools use many alternative notations for the same or similar concepts
- One popular alternative notation uses **UML class diagrams**
- See next slides for UML class diagrams and other alternative notations

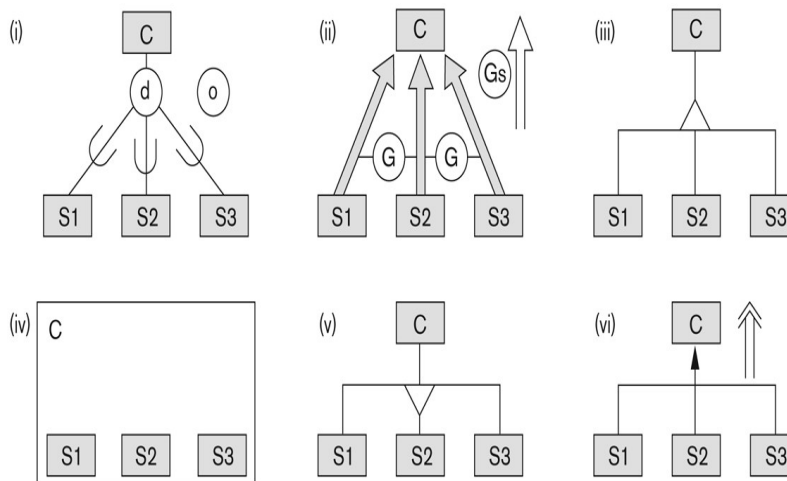

# Specialization/Generalization (UML)

**Figure 4.10**  
A UML class diagram corresponding to the EER diagram in Figure 4.7, illustrating UML notation for specialization/generalization.

EER Model 45

# Specialization/Generalization

EER Model 46

## General Conceptual Modeling Concepts

- ⊙ General data abstractions
  - ⊙ Classification and Instantiation
  - ⊙ Aggregation and Association (relationships)
  - ⊙ Generalization and Specialization
  - ⊙ Identification
- ⊙ Constraints
  - ⊙ Cardinality (Min and Max)
  - ⊙ Coverage (Total vs. Partial, and Exclusive (disjoint) vs. Overlapping)

EER Model 47

## Ontologies

- ⊙ Use conceptual modeling and other tools to develop "a **specification of a conceptualization**"
  - ⊙ **Specification** refers to the language and vocabulary (data model concepts) used
  - ⊙ **Conceptualization** refers to the description (schema) of the concepts of a particular field of knowledge and the relationships among these concepts
- ⊙ Many medical, scientific, and engineering ontologies are being developed as a means of standardizing concepts and terminology

EER Model 48

## Design Issues (1)

- ⊙ Use of entity sets vs. attributes
  - ⊙ Choice mainly depends on the structure of the enterprise being modeled, and on the semantics associated with the attribute in question
  - ⊙ *E.g., should Phone be an attribute of Employee or a separate entity?*
- ⊙ Use of entity sets vs. relationship sets
  - ⊙ Possible guideline is to designate a relationship set to describe an *action that occurs between entities*

EER Model 49

## Design Issues (2)

- ⊙ Binary versus *n*-ary relationship sets
  - ⊙ Although it is possible to replace any nonbinary (*n*-ary, for  $n > 2$ ) relationship set by a number of distinct binary relationship sets, a *n*-ary relationship set shows more clearly that several entities participate in a **single** relationship
- ⊙ Placement of relationship attributes
- ⊙ The use of a strong or weak entity set
- ⊙ The use of specialization contributes to modularity in the design

EER Model 50

## Entity vs. Attribute

- Works\_In4 does not allow an employee to work in a department for two or more periods.
- What if we want to record all possible periods an employee worked in a particular department?

EER Model 51

## Entity vs. Relationship

- Manager gets a **separate** budget for each dept.
- What if a manager gets a budget that covers **all managed depts**?

EER Model 52

## Design Principles

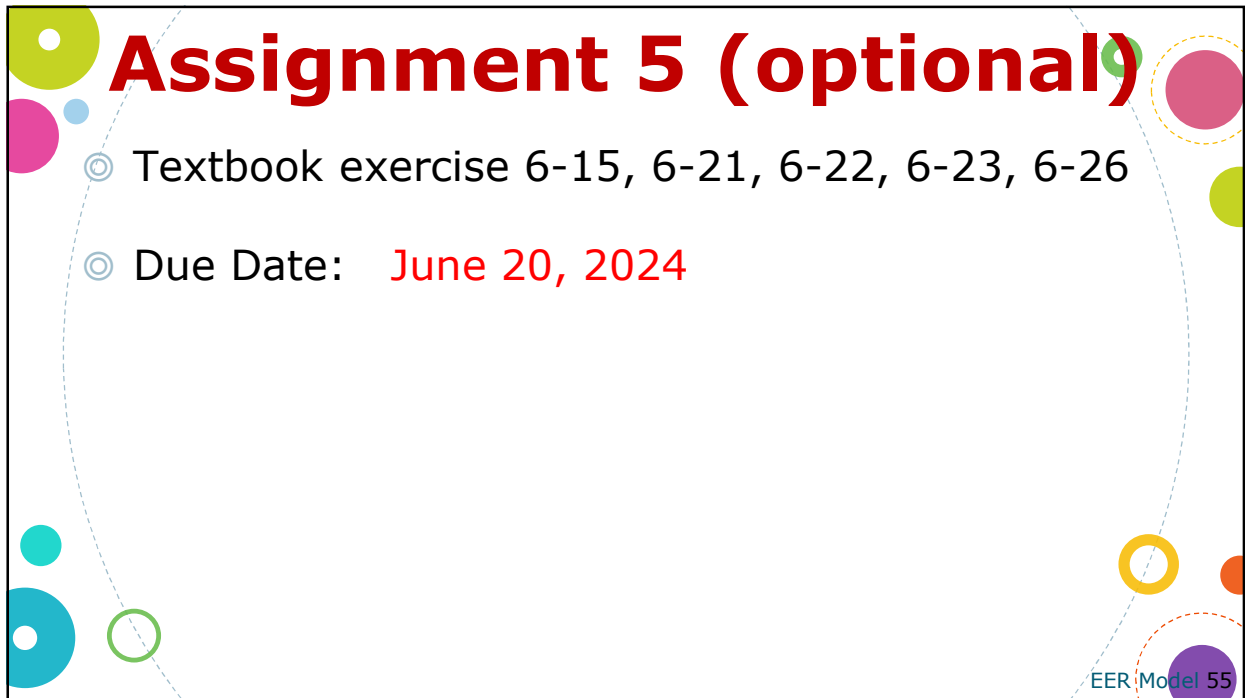

- ⦿ What makes a design **good** or **bad**?
- ⦿ Design should be **faithful** to specifications
- ⦿ **Avoid redundancy** – more on normalization later!
- ⦿ Keep it **simple**
  - ⦿ Avoid creating unnecessary entities/relationships
- ⦿ Pick the **right** kind of element (see examples “Entity vs. Relationship” and “Entity vs. Attribute”)
  - ⦿ Rule of thumb: if *thing has more info than just its name* make it an entity

EER Model 53

## Summary

- ⦿ Introduced the EER model concepts
  - ⦿ Class/subclass relationships
  - ⦿ Specialization and generalization
  - ⦿ Inheritance
- ⦿ These augment the basic ER model concepts introduced earlier
- ⦿ EER diagrams and alternative notations were presented

EER Model 54

**Assignment 5 (optional)**

- ⦿ Textbook exercise 6-15, 6-21, 6-22, 6-23, 6-26
- ⦿ Due Date: **June 20, 2024**

EER Model 55
